The authors regret missing a citation for the *epaA/epaB* prophage genes. The updated text below features the included reference 16.

Line 22–24: "Recently, the CPS structure from a clinical isolate, BAL062 which includes KL58 locus, was found to have a pseudaminic acid isomer (8ePse5NAc7NAc) as a result of prophage inserted *epaA/epaB* genes [16]."

Line 50–52: "… the CPS was shown to be 8-epi-pseudaminic acid (8ePse5NAc7NAc), an epimer of Pse5NAc7NAc, as two genes, *epaA/epaB*, in a prophage region of BAL062 genome converted Pse to 8ePse [16]."

Line 187–190: "Additionally, the published CPS structure from strain BAL062 differs from the K58 only at the C-8 of non-2-ulosonic acid, Pse5NAc7NAc in K58 and 8ePse5NAc7NAc in BAL062, due to two genes, *epaA/epaB* from prophage that epimerized Pse to 8ePse [16]."
