Presentation Outline

- National Research Council
- Building Information Modeling
 - Background
 - Fire Simulation and Evacuation in buildings
- Fire safety issues in tunnels
 - Integrated safety policy
 - Fire development & Egress time model
 - Human response
- Case studies

National Research Council

NRC-CNRC

- National organization, federal government agency
- Over 4,200 full-time employees; over 1,446 guest workers
- Labs and facilities across Canada
- Dissemination of S&T information to industry and scientific community
- Provides essential elements infrastructure

The Canadian Construction Sector

NRC-CNRC

12% of GDP
\$146.1 billion capital expenditures
Over \$5.5 trillion built assets*
Largest employer > 1M
Low R & D expenditures

*Source: NRC-IRC Advanced Asset Management: Tools and Techniques

Facilities account for 35-40% of national energy consumption
Generates 25% of Canada's solid waste
Consumes >50% of primary natural resources
Long product life means enduring impact
Generates 30% of total GHGs

Institute for Research in Construction

NRC-CNRC

Established 1947
Guided by industry advisory board
and 2 Commissions
\$33 million budget,
238 employees, 40 visiting workers
Ottawa, Regina and London

2010 NENA Ontario Confer

Fire Research Program

Building Information Modeling

-
- The diagram illustrates the Building Information Modeling (BIM) process. At the center is a 3D model of a building, labeled "BUILDING INFORMATION MODELING". Surrounding this central model is a circular flow of seven roles, connected by a large purple arrow that forms a continuous loop. The roles, starting from the top and moving clockwise, are:
- OWNERS
 - ARCHITECTS
 - CIVIL ENGINEERS
 - STRUCTURAL ENGINEERS
 - MEP SYSTEMS ENGINEERS
 - BUILDERS & FABRICATORS
 - An arrow pointing back to OWNERS, completing the cycle.
- Each role is represented by a small 3D icon of a building or construction element, such as a crane for Builders & Fabricators or a road intersection for Civil Engineers.

4

Dynamic Building Information Modeling

NRC-CNRC

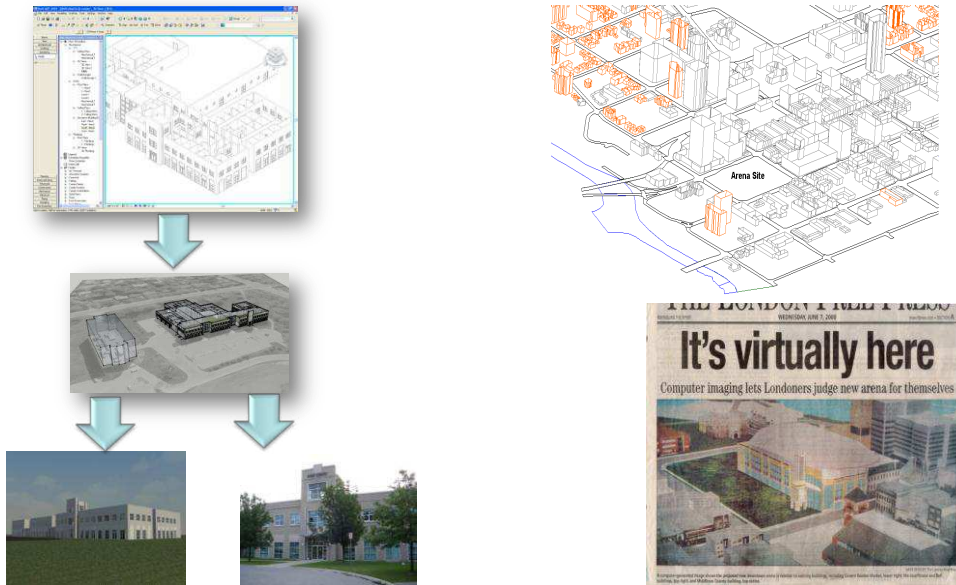

BIM & Fire Safety

NRC-CNRC

- Code & Standard
- Fire resistant rated construction
- Sprinklers, type strength angle
- Alarms
- Fire Extinguisher
- Evacuation
- Dangerous materials

Geographical Rendering and Neighbourhood Impact

NRC CNRC

Building Information Modeling Walk through & Evacuation

NRC CNRC

Building Information Modeling As Built

ARC-CMRC

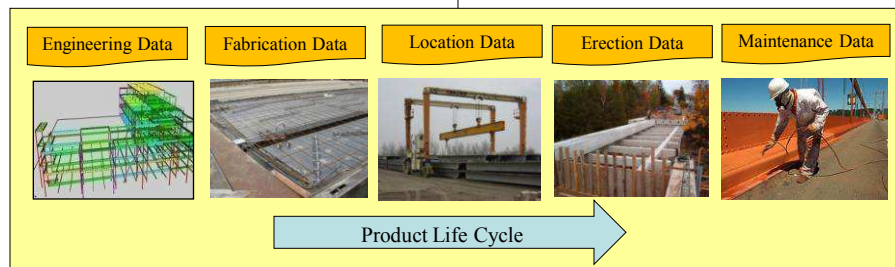

- Large Data for Building Scans
 - As built, As Design Philosophy
 - Virtual sites
 - Accurate Data capturing, Surface parameters computation
 - Sectional and Feature Contours
 - Building layouts, Feature and Section Identification
 - Partial model surface can be created where required
 - Handling Large Data
 - Data Simplification, Segmentation
 - Measurements
 - Dimensions, Angles, Areas, Volumes etc

Product Life Cycle Traceability of Structures

FIRE SAFETY ISSUES IN TUNNELS

2010 NENA Ontario Conference and Trade Show, September 27th – 29th

BACKGROUND

❑ Fires in tunnels have caused significant risk to human life and damage to property and economy

- Direct costs are extremely high
 - Large number of deaths and injuries over last decade;
 - Damage to tunnel structure and facilities (annual cost of tunnel fires in Europe estimated at €210 Million);
- Indirect costs are very high
 - Significant economy and political impact;
 - Loss of confidence in using tunnels.

2010 NENA Ontario Conference and Trade Show, September 27th – 29th

BACKGROUND

Fires within confines of underground systems are among the most difficult to extinguish because:

- fire fighters have limited room in which to operate
- limited access points for fire personnel
- emergency exits locations
- availability of water supply
- ventilation capabilities

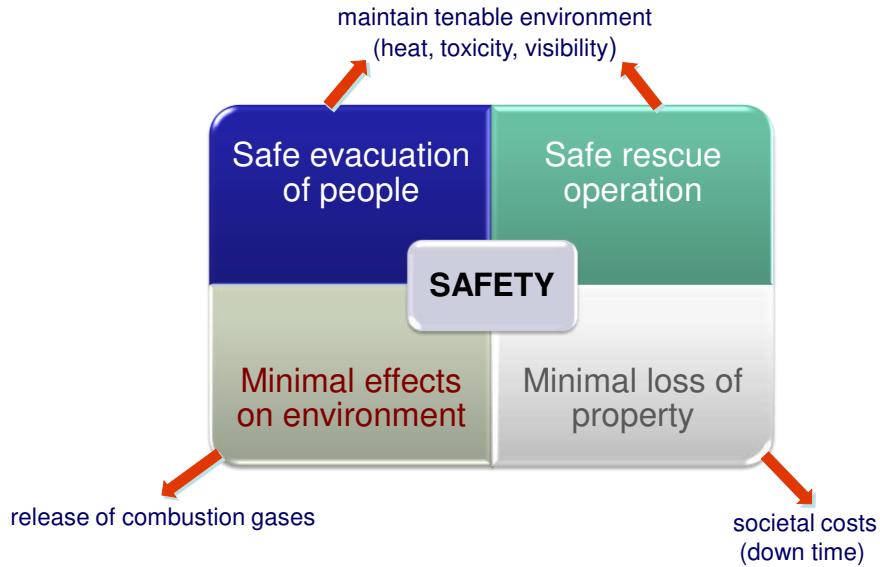

2010 NENA Ontario Conference and Trade Show, September 27th – 29th

TUNNEL INCIDENT

2010 NENA Ontario Conference and Trade Show, September 27th – 29th

FIRE SAFETY ISSUES IN TUNNELS

2010 NENA Ontario Conference and Trade Show, September 27th – 29th

INTEGRATED SAFETY POLICY

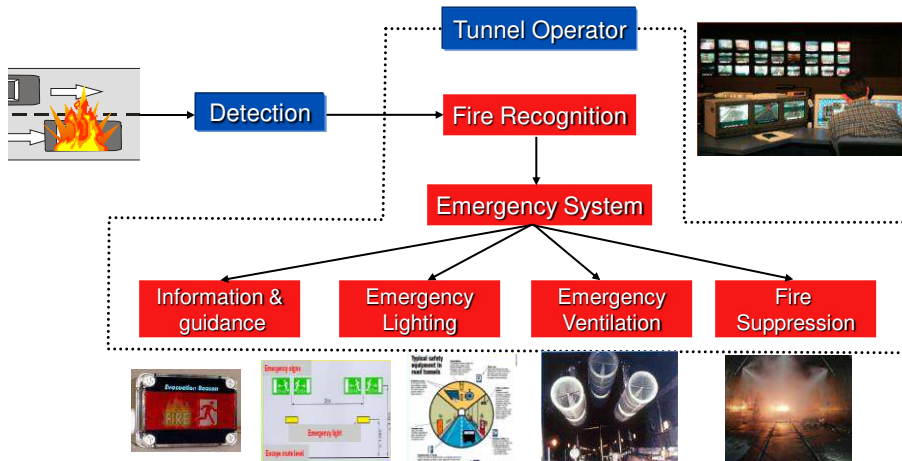

2010 NENA Ontario Conference and Trade Show, September 27th – 29th

DESIGN

2010 NENA Ontario Conference and Trade Show, September 27th – 29th

FIRE PROTECTION MATRIX

2010 NENA Ontario Conference and Trade Show, September 27th – 29th

FIRE DEVELOPMENT

2010 NENA Ontario Conference and Trade Show, September 27th – 29th

DESIGN CRITERIA

- ❖ Air Temperatures Criteria
- ❖ Air Carbon Monoxide (CO) Criteria
- ❖ Smoke Obscuration Criteria – Visibility
- ❖ Radiation Heat Flux Criteria

2010 NENA Ontario Conference and Trade Show, September 27th – 29th

DESIGN CRITERIA

- ❖ Air Temperatures Criteria
- ❖ Air Carbon Monoxide (CO) Criteria
- ❖ **Smoke Obscuration Criteria – Visibility**
- ❖ Radiation Heat Flux Criteria

2010 NENA Ontario Conference and Trade Show, September 27th – 29th

FIRE DEVELOPMENT

2010 NENA Ontario Conference and Trade Show, September 27th – 29th

TERMINOLOGY

RSET (Required Safe Escape Time)

Time necessary between ignition of a fire and time at which all occupants can reach an area of safety.

ASET (Available Safe Escape Time)

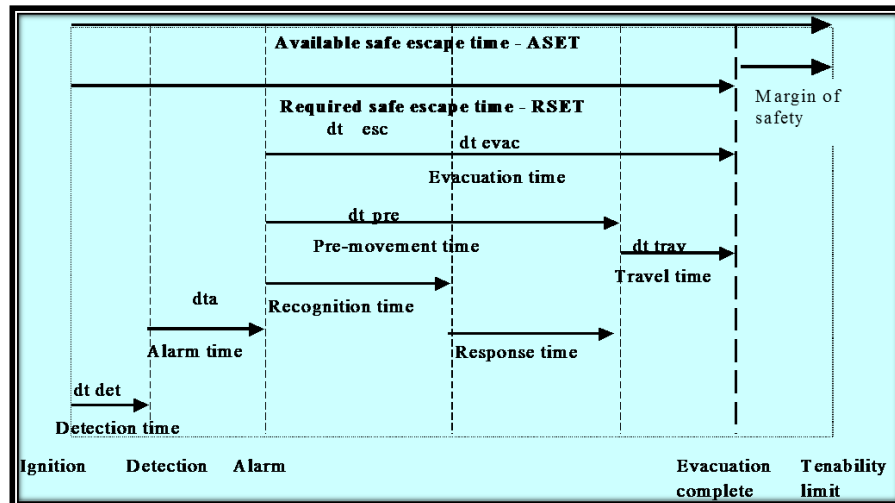

Time available between ignition of a fire and time at which tenability criteria are exceeded in means of egress.

RSET should be shorter than **ASET** by an acceptable Margin of Safety.

2010 NENA Ontario Conference and Trade Show, September 27th – 29th

EGRESS TIME MODEL

Model divides up time available for evacuation into several stages:

MAIN FACTORS THAT ACCELERATE OR DELAY OCCURRENCE OF EGRESS BEHAVIOURS

(SOCIETY OF FIRE PROTECTION ENGINEERS, SFPE)

NRC-CNRC

	Main factors that can accelerate the occurrence of egress behavior
Phase 0: onset of the event	<ul style="list-style-type: none"> Proximity of hazard source. Familiarity with environment. Experience/training.
Phase 1: Perception and recognition of the alert signals.	<ul style="list-style-type: none"> Proximity of hazard source. Intensity of alert. Clear messages on risk level. Credibility of information given/perceived. Collective move towards emergency exits.

2010 NENA Ontario Conference and Trade Show, September 27th – 29th

MAIN FACTORS THAT ACCELERATE OR DELAY OCCURRENCE OF EGRESS BEHAVIOURS

(SOCIETY OF FIRE PROTECTION ENGINEERS, SFPE)

NRC-CNRC

	Main factors that can accelerate the occurrence of egress behavior
Phase 2: To make a decision about hazards reality and to evacuation preparation	<ul style="list-style-type: none"> Clear messages on risk level. Information on emergency exits & what to do. Credibility of information given/received. Emergence of leader organizing evacuation. Collective move towards evacuation. Good visibility.
Phase 3: Move towards getting safe	<ul style="list-style-type: none"> Smoke well controlled. Lighting and good visibility. Information on emergency exits & what to do.

2010 NENA Ontario Conference and Trade Show, September 27th – 29th

MAIN FEATURES OF THE SELF-RESCUE CONCEPT

Emergency station with Fire-extinguishers and push button
at least every 150 m (250 m)

Emergency exit
at least every 500 m

Escape route markings and emergency lights
every 25m at a height of 1,0 to 1,5 m above escape route level

Cross Section with Tunnel Equipment

2010 NENA Ontario Conference and Trade Show, September 27th – 29th

EU leaflet

What to do when you are entering a tunnel	What to do in the event of breakdown or accident
<ul style="list-style-type: none"> Listen to the radio station indicated by the sign Switch on your headlights. Take off your sunglasses Obey traffic lights and signs Keep a safe distance from the vehicle in front Do not overtake if there is only one lane in each direction Do not turn or reverse. Do not stop, except in an emergency 	<ul style="list-style-type: none"> Switch on your warning lights Try to move your vehicle to an emergency lane or lay-by or at least to the hard shoulder Switch off the engine Leave your vehicle If necessary and possible, give first aid to injured people Call for help from an emergency station
What to do in traffic congestion	What to do if your or another vehicle is on fire
<ul style="list-style-type: none"> Switch on your warning lights Keep your distance, even if you are moving slowly or have stopped Switch off your engine, if the traffic has come to a halt Listen to messages on the radio Follow the instructions given by tunnel officials or obey variable message signs 	<ul style="list-style-type: none"> If your vehicle is on fire, if possible drive out of the tunnel If that is not possible, pull over to the side, switch off the engine and leave the vehicle immediately Call for help from an emergency station If you can, put out the fire using an extinguisher available in the tunnel If you can, give first aid to injured people Go, as soon as possible, to an emergency exit
Remember: Check fuel and turn on radio before entering a tunnel!	Remember: Fire and smoke can kill - save your life, not your car!

2010 NENA Ontario Conference and Trade Show, September 27th – 29th

HUMAN RESPONSE

2010 NENA Ontario Conference and Trade Show, September 27th – 29th

Who is the human in Human Response?

Tunnel user

INTERACTION !!

Tunnel operator

Emergency response teams

2010 NENA Ontario Conference and Trade Show, September 27th – 29th

MOST COMMON BEHAVIOUR

- Panic
- Absence of response
- Commitment

→ How long will this inertia last?

THE INITIAL MOMENT

- ❖ Investigating ambiguous cues
- ❖ Fire fighting
 - Unlikely to take place
- ❖ Milling with others to discuss situation
 - Provide information to help passengers make decisions

WARNING USERS (CUES)

NRC-CNRC

- Auditory alarms
 - Location
 - Intensity (background noise)
 - Signal type
- Other cues
 - Smoke
 - Heat

2010 NENA Ontario Conference and Trade Show, September 27th – 29th

QUESTIONS

NRC-CNRC

- ☐ What do people think when getting involved in accident?
- ☐ Do they understand what is going on?
- ☐ When do they understand and based on what cue?
- ☐ Idea is that providing information would help, but.....
- ☐ Is this the case?
- ☐ Do people know how to apply this?
- ☐ And..... is it enough?

2010 NENA Ontario Conference and Trade Show, September 27th – 29th

DRIVING SIMULATOR STUDY

2010 NENA Ontario Conference and Trade Show, September 27th – 29th

DRIVING SIMULATOR STUDY

SCENARIO – Altogether 60 drivers, 20 per group (no prior information, leaflet, Leaflet and operator voice):

- ❖ Busy traffic
- ❖ Traffic slows down due to accident 1 km upstream
- ❖ Entering the tunnel it gets to a stop
- ❖ 3.5 min after accident, smoke enters the tunnel
- ❖ Gets thicker and thicker

- ❑ After 10 min without action, experiment stopped
- ❑ If people indicate to get out and Stopped.

2010 NENA Ontario Conference and Trade Show, September 27th – 29th

CONCLUSIONS

- ❖ Did not reach 100% stated evacuation !!
- ❖ EU leaflet helps but is not enough
- ❖ Even with operator voice still doubt (smoke)
- ❖ Radio is not often used as information channel
- ❖ People still indicate they don't know how to handle
- ❖ People also want to know what is going on
- ❖ Enough information from a designer's point of view is not always enough for the tunnel user.

2010 NENA Ontario Conference and Trade Show, September 27th – 29th

REAL LIFE EVACUATION STUDIES

2010 NENA Ontario Conference and Trade Show, September 27th – 29th

REAL LIFE EVACUATION STUDIES

- ❖ No instruction about possible accident
- ❖ Smoking truck stops in tunnel and blocks lanes
- ❖ 193 cars in 7 tests, 1 person per car
- ❖ 5 minutes: operator voice
- ❖ 7 minutes another.

2010 NENA Ontario Conference and Trade Show, September 27th – 29th

CONCLUSIONS

- ❖ People need between 5 to 15 minutes to decide whether they should do anything at all and finally what to do.
- ❖ New information vital to inform people they are no longer in normal situation.
- ❖ During anxiety a person's focus becomes very narrow – only allowing processing of most obvious elements of environment.
- ❖ In case of emergencies all communications should be simple, brief, and obvious.
- ❖ To avoid panic and stampede, people must think escape routes open or accessible and escaping time is adequate.
- ❖ Moderate level of stress required to motivate appropriate human response.

2010 NENA Ontario Conference and Trade Show, September 27th – 29th

EVACUATION STUDY TUNNEL STUDY CENTRE (CETU)

2010 NENA Ontario Conference and Trade Show, September 27th – 29th

TUNNEL STUDY CENTRE (CETU)

Evaluation experiment were performed with ten users faced with a situation of coming to stop in the tunnel and the triggering of all the devices foreseen to favor their self evacuation

2010 NENA Ontario Conference and Trade Show, September 27th – 29th

TUNNEL STUDY CENTRE (CETU)

- ❑ Light smoke: dynamic and static visual devices remain visible
- ❑ Thick smoke: static devices not seen and chevrons remain faintly visible
- ❑ Flashing light are last visible elements up to 25 m
- ❑ Audio devices remain audible, in spite of forced ventilation operation
- ❑ All users detected various devices (visual and audio) and understood their roles (induced necessity of evacuation)

2010 NENA Ontario Conference and Trade Show, September 27th – 29th

TUNNEL STUDY CENTRE (CETU)

- ❑ Alarm function of siren was well understood (danger signal)
- ❑ Audio beacons give indication of action and place
- ❑ Dynamic visual device (chevrons) show and guide to the place where it is necessary to go
- ❑ All users self-evacuated in less than two minutes. It is the whole of the device, the combination of audio and visual, which triggered the self-evacuation by the users
