

2010 National Building Code of Canada (NBC)

## 2013 Revisions and Errata Package for Second Printing

Selected replacement pages have been produced for the NBC.

Please print and insert in your copy of the Code.

# Revisions and Errata

## Issued by the Canadian Commission on Building and Fire Codes

The Change History table that follows describes revisions, errata and editorial updates that apply to the National Building Code of Canada 2010:

- Revisions are changes deemed urgent that have been approved by the Canadian Commission on Building and Fire Codes.
- Errata are corrections to existing text.
- Editorial updates are provided for information purposes only.

Code pages containing revisions and/or errata are identified with the words “Amended Page” in the footer; pages with editorial updates and index pages with changes are not flagged.

Contact your local authority having jurisdiction to find out if these revisions and errata apply in your province or territory.

### Change History — National Building Code of Canada 2010

Division	Code Reference	Change	Date (Y-M-D)	Description of Change
Preface	n/a	editorial update	2012-12-21	Text referring to application statements was deleted as these statements are no longer being published
A	1.4.2.1.(1)	editorial update	2012-12-21	The following abbreviations were added to the list as a result of the addition of new Section 9.36.: HDD, HVAC, K, R, RSI and U-value
A	1.5.1.1.(1)	revision	2012-12-21	Sentence was revised to read “Except as provided in Sentence (2), the provisions ...”
A	1.5.1.1.(2)	revision	2012-12-21	Sentence was added
A	2.1.1.2.	revision	2012-12-21	Reference to Appendix Note was added following Article title
A	2.1.1.2.(1)	revision	2012-12-21	Sentence was revised to read “Except as provided in Sentences (2) to (6), ...”
A	2.1.1.2.(6)	revision	2012-12-21	Sentence was added
A	2.2.1.1.(1)	revision	2012-12-21	Objective OE, Environment, and sub-objectives OE1, Resources, and OE1.1, excessive use of energy, were added
A	3.1.1.2.(1)	revision	2012-12-21	Sentence was revised to read “Except as provided in Sentences (2) to (4), ...”
A	3.1.1.2.(4)	revision	2012-12-21	Sentence was added
A	3.2.1.1.(1)	revision	2012-12-21	Functional Statements F90–F93, F95, F96 and F98–F100 were added
A	A-2.1.1.2.(6)	revision	2012-12-21	Appendix Note was added
A	A-2.2.1.1.(1)	revision	2012-12-21	Reference to the National Energy Code for Buildings was added
A	A-3.2.1.1.(1)	revision	2012-12-21	Reference to the National Energy Code for Buildings was added
B	1.3.1.1.(1)	revision	2013-10-31	Date stated in Sentence was revised to read “30 June 2012”
B	Table 1.3.1.2.	revision	2012-12-21	Standards referenced in new Section 9.36. were added
B	Table 1.3.1.2.	revision	2012-12-21	ASTM F 1667-05 was added as a result of revisions to Sentences 9.23.3.1.(1), 9.26.2.2.(1) and 9.29.5.6.(1)
B	Table 1.3.1.2.	revision	2013-10-31	Document references were updated as applicable to reflect more recent editions published as of June 30, 2012

## Change History — National Building Code of Canada 2010 (Continued)

Division	Code Reference	Change	Date (Y-M-D)	Description of Change
B	1.3.2.1.(1)	editorial update	2012-12-21	The following abbreviations and applicable addresses were added as a result of new Section 9.36.: AHAM, AHRI, CTI, DOE, ICC, NECB and NFRC; the address for TPIC was updated
B	3.2.3.4.(1)	erratum	2012-12-21	Change bar was added
B	3.2.4.22.(10)	erratum	2012-12-21	Sentence was corrected to read "... required by Sentence (7) .."
B	3.4.7.7.(1)	erratum	2012-12-21	Sentence was corrected to read "... Articles 3.4.6.3. and 3.4.6.4."
B	4.1.7.1.(5)	erratum	2012-12-21	Clause (b) was corrected to read "... or 20 times the height of the <i>building</i> , whichever is greater ..." Clause (c) was corrected to read "... or 20 times the height of the <i>building</i> from a change in terrain conditions ..."
B	5.2.2.1.(2)	revision	2012-12-21	Sentence was revised to read "... Except as provided in Article 4.1.8.18., the structural loads ..."
B	5.10.1.1.(1)	erratum	2012-12-21	Sentence was corrected to read "... Except as provided in Sentence (2) and elsewhere in this Part, ..."
B	6.2.1.4.(1)	erratum	2013-10-31	Word "and" at the end of Clause (e) was replaced with "or"
B	6.2.2.1.(3)	erratum	2012-12-21	Sentence was modified to clarify intent
B	6.2.2.6.(1)	erratum	2013-10-31	Sentence was corrected to read "Except as provided in Subsection 6.2.12., systems ..."
B	6.2.4.1.(4)	erratum	2012-12-21	Change bar was added
B	Table 6.4.1.1.	erratum	2012-12-21	Functional Statement F43 was deleted from attribution for Sentence 6.2.1.7.(2)
B	8.2.1.3.(1)	erratum	2012-12-21	Sentence was corrected to read "... and is located 2 m or more from a <i>public way</i> , ..."
B	9.4.1.1.(2)	erratum	2013-10-31	Sentence was corrected to read "... on the floor according to Table 4.1.5.3. shall not exceed 2.4 kPa."
B	9.4.2.1.(1)	erratum	2013-10-31	Text "(See Appendix A.)" was moved from the end of the Sentence to following title of Article 9.4.2.2.
B	9.7.2.2.	revision	2012-12-21	Sentences (1) to (9) were reordered and Sentence (10) was added
B	9.10.9.7.(2)	erratum	2012-12-21	Term "firestop system" was replaced with defined term " <i>fire stop</i> "
B	9.10.14.5.(3)	erratum	2012-12-21	Word "and" at the end of the Clause (b) was deleted Subclause (e)(i) was corrected to read "... conforms to Subsection 9.27.12.,"
B	9.10.15.5.(2)	erratum	2012-12-21	Subclause (b)(i) was corrected to read "... conform to Subsection 9.27.12.,"
B	9.12.2.2.(1)	erratum	2012-12-21	Sentence was corrected to read "... Except as provided in Sentences (4) to (7), ..."
B	9.19.2.1.(1)	revision	2012-12-21	Sentence was revised
B	9.23.3.1.	revision	2012-12-21	Sentence (1) was revised Sentence (2) was added
B	9.23.6.1.(3)	erratum	2013-10-31	Sentence was corrected to read "... greater than 0.70 but not greater than 1.2 or the 1-in-50 hourly ..."
B	9.23.13.7.(7)	erratum	2012-12-21	Sentence was corrected to read "... the ratio of the length of <i>braced wall panels</i> in the respective upper <i>braced wall bands</i> to the length of <i>braced wall panels</i> in the reduced exterior <i>braced wall band</i> ..."
B	9.23.16.5.(2)	erratum	2013-10-31	Word "and" at the end of Clause (a) was replaced with "or"
B	9.25.1.1.(2)	revision	2012-12-21	Subclause (a)(i) was revised to read "thermal insulation conforming to Subsection 9.25.2. and Section 9.36.," Subclause (a)(ii) was revised to read "an air barrier conforming to Subsection 9.25.3. and Section 9.36.,"
B	9.25.1.1.(3)	revision	2012-12-21	Sentence was revised to read "... Sections 9.32., 9.33. and 9.36."
B	9.25.5.1.(1)	erratum	2012-12-21	Word "and" was added at the end of Subclause (a)(i)
B	9.26.2.2.(1)	revision	2012-12-21	Clause (b) was added
B	9.29.5.6.(1)	revision	2012-12-21	Clause (b) was added
B	9.31.1.1.(4)	revision	2012-12-21	Sentence was added
B	9.32.1.1.(4)	revision	2012-12-21	Sentence was added

### Change History — National Building Code of Canada 2010 (Continued)

Division	Code Reference	Change	Date (Y-M-D)	Description of Change
B	9.32.3.1.(1)	erratum	2012-12-21	Clause (c) was added to clarify intent
B	9.32.3.11.(4)	revision	2012-12-21	Sentence was restructured and requirement was added as Clause (b)
B	9.33.1.1.(4)	revision	2012-12-21	Sentence was added
B	Section 9.36.	revision	2012-12-21	Section was added
B	Table 9.36.4.2.	erratum	2013-10-31	Table Note (1) was corrected to read “1 kW = 3412 Btu/h”
B	9.36.5.11.(15)	erratum	2013-10-31	Clause (b) was corrected to read “0.0251 for all other types of heating systems.”
B	9.36.5.15.(14)	erratum	2013-10-31	Clause (b) was corrected to read “0.0251 for all other types of heating systems.”
B	Table 9.37.1.1.	revision	2012-12-21	Attributions were added for new Sentence 9.23.3.1.(2) and new Section 9.36.
B	A-1.1.2.1.(1)	erratum	2012-12-21	Appendix Note was corrected to read “... at the end of Volume 1.”
B	Table A-1.3.1.2.(1)	revision	2012-12-21	Standards referenced in new Appendix Notes A-9.36.1.1.(1) to A-9.36.5.15.(8) were added
B	Table A-1.3.1.2.(1)	revision	2013-10-31	Document references were updated as applicable to reflect more recent editions published as of June 30, 2012
B	A-4.1.5.8.	erratum	2013-10-31	Text was corrected to read “... Commentary entitled Live Loads ...”
B	A-5.2.2.1.(2)(c)	revision	2012-12-21	Second paragraph was added
B	A-9.4.2.1.(1)	erratum	2013-10-31	Appendix Note number was corrected to read “A-9.4.2.2.”
B	A-9.8.8.6.(2)	erratum	2012-12-21	Offset shown in top guard protrusion in Figure A-9.8.8.6.(2)-B was corrected
B	A-9.10.15.4.(2)	erratum	2012-12-21	In Figure A-9.10.15.4.(2)-C, Table Notes on “required” and “noncombustible” were corrected for limiting distance <sub>2</sub> to limiting distance <sub>3</sub>
B	A-9.10.22.	erratum	2012-12-21	Word “range” was replaced with “cooktop” in title, text and Figure title
B	A-9.19.2.1.(1)	revision	2012-12-21	Appendix Note was added
B	A-9.23.3.1.(2)	revision	2012-12-21	Appendix Note was added
B	A-Table 9.23.4.3.	erratum	2013-10-31	Text in last two bullets was corrected as follows: <ul style="list-style-type: none"> <li>• live load: first floor = 1.9 kPa; second floor = 1.4 kPa</li> <li>• dead load = 1.5 kPa (0.5 kPa floor + 1.0 kPa partition)</li> </ul>
B	A-9.32.3.3.	erratum	2012-12-21	Word “range” was replaced with “cooktop” in third paragraph under section entitled “Indoor Air Exhaust”
B	A-9.32.3.3.(10)	erratum	2012-12-21	Appendix Note was corrected to read “... the use of a cooktop exhaust or hood fan ...”
B	A-9.36.1.1.(1) to A-9.36.5.15.(8)	revisions	2012-12-21	Eighty-four Appendix Notes were added
B	Table C-2	erratum	2012-12-21	Value for S <sub>a</sub> (2.0) for Sault Ste. Marie was corrected to read “0.012”
B	Table D-1.1.2.	revision	2013-10-31	Document references were updated as applicable to reflect more recent editions published as of June 30, 2012
C	2.2.8.	revision	2012-12-21	Subsection was added
C	A-2.2.8.1.(1)	revision	2012-12-21	Appendix Note was added
C	A-2.2.8.3.(2)(c)(i)	revision	2012-12-21	Appendix Note was added
Index	Letter A	erratum	2012-12-21	Entry under “Application of the National Building Code, factory-made buildings” was corrected to read “factory-constructed buildings”
Index	Letter F	erratum	2012-12-21	Entry for “Factory-made buildings” was corrected to read “Factory-constructed buildings” Under entry for “Fans,” “range-top” was corrected to read “cooktop” Entry for “Fire blocks” was added Entry for “Fire stopping” was corrected Entry for “Fire stops” was corrected
n/a	Conversion Factors	editorial update	2012-12-21	Factor to convert kW to Btu/h was added: 3.412
		erratum	2013-10-31	Factor to convert kW to Btu/h was corrected to read “3412”

# **Part 1 General**

## **Section 1.1. General**

### **1.1.1. Application**

#### **1.1.1.1. Application**

**1)** This Part applies to all *buildings* covered in this Code. (See Article 1.1.1.1. of Division A.)

### **1.1.2. Objectives and Functional Statements**

#### **1.1.2.1. Attributions to Acceptable Solutions**

**1)** For the purpose of compliance with this Code as required in Clause 1.2.1.1.(1)(b) of Division A, the objectives and functional statements attributed to the acceptable solutions in Division B shall be the objectives and functional statements identified in Sections 3.9., 4.5., 5.11., 6.4., 7.2., 8.3. and 9.37. (See Appendix A.)

### **1.1.3. Climatic and Seismic Data**

#### **1.1.3.1. Climatic and Seismic Values**

**1)** The climatic and seismic values required for the design of *buildings* under this Code shall be in conformance with the values established by the *authority having jurisdiction* or, in the absence of such data, with Sentence (2) and the climatic and seismic values in Appendix C. (See Appendix A.)

**2)** The outside winter design temperatures determined from Appendix C shall be those listed for the January 2.5% values. (See Appendix A.)

#### **1.1.3.2. Depth of Frost Penetration**

**1)** Depth of frost penetration shall be established on the basis of local experience.

### **1.1.4. Fire Safety Plan**

#### **1.1.4.1. Fire Safety Plan**

**1)** Where a fire safety plan is required, it shall conform to Section 2.8. of Division B of the NFC.

## **Section 1.2. Terms and Abbreviations**

### **1.2.1. Definitions of Words and Phrases**

#### **1.2.1.1. Non-defined Terms**

**1)** Words and phrases used in Division B that are not included in the list of definitions in Article 1.4.1.2. of Division A shall have the meanings that are commonly assigned to them in the context in which they are used, taking into account the

specialized use of terms by the various trades and professions to which the terminology applies.

**2)** Where objectives and functional statements are referred to in Division B, they shall be the objectives and functional statements described in Parts 2 and 3 of Division A.

**3)** Where acceptable solutions are referred to in Division B, they shall be the provisions stated in Parts 3 to 9.

### 1.2.1.2. Defined Terms

**1)** The words and terms in italics in Division B shall have the meanings assigned to them in Article 1.4.1.2. of Division A.

## 1.2.2. Symbols and Other Abbreviations

### 1.2.2.1. Symbols and Other Abbreviations

**1)** The symbols and other abbreviations in Division B shall have the meanings assigned to them in Article 1.4.2.1. of Division A and Article 1.3.2.1.

## Section 1.3. Referenced Documents and Organizations

### 1.3.1. Referenced Documents

#### 1.3.1.1. Effective Date

**1)** Unless otherwise specified herein, the documents referenced in this Code shall include all amendments, revisions, reaffirmations, reapprovals, addenda and supplements effective to 30 June 2012.

#### 1.3.1.2. Applicable Editions

**1)** Where documents are referenced in this Code, they shall be the editions designated in Table 1.3.1.2. (See Appendix A.)

**Table 1.3.1.2.**  
**Documents Referenced in the National Building Code of Canada 2010**  
Forming Part of Sentence 1.3.1.2.(1)

Issuing Agency	Document Number <sup>(1)(2)</sup>	Title of Document <sup>(3)</sup>	Code Reference
AHAM	ANSI/AHAM RAC-1-1982	Room Air Conditioners	Table 9.36.3.10.
AHRI	ANSI/AHRI 210/240-2008	Performance Rating of Unitary Air-Conditioning and Air-Source Heat Pump Equipment	Table 9.36.3.10.
AHRI	ANSI/AHRI 1060-2005	Performance Rating of Air-to-Air Exchangers for Energy Recovery Ventilation	9.36.3.8.(4)
AHRI	BTS-2000	Efficiency of Commercial Space Heating Boilers	Table 9.36.3.10.
AISI	S201-07	North American Standard for Cold-Formed Steel Framing - Product Data	9.24.1.2.(1)
ANSI	A208.1-2009	Particleboard	Table 5.10.1.1. 9.23.15.2.(3) 9.29.9.1.(1) 9.30.2.2.(1)
ANSI/CSA	ANSI Z21.10.3-2004/CSA 4.3-04	Gas Water Heaters – Volume III, Storage Water Heaters With Input Ratings Above 75,000 Btu Per Hour, Circulating and Instantaneous	Table 9.36.4.2.
ANSI/CSA	ANSI Z21.56-2006/CSA 4.7-2006	Gas-Fired Pool Heaters	Table 9.36.4.2.

**Notes to Table 1.3.1.2.:**

- (1) Some documents may have been reaffirmed or reapproved. Check with the applicable issuing agency for up-to-date information.
- (2) Some documents referenced in the energy efficiency provisions in Section 9.36. were published after the date specified in Sentence 1.3.1.1.(1).
- (3) Some titles have been abridged to omit superfluous wording.
- (4) Code reference is in Division A.
- (5) Notwithstanding the effective date stated in Sentence 1.3.1.1.(1), the 2013 edition of NFPA 13 is referenced as it better meets the intent of the Code.

**1.3.2. Organizations****1.3.2.1. Abbreviations of Proper Names**

**1)** The abbreviations of proper names in this Code shall have the meanings assigned to them in this Article (the appropriate addresses of the organizations are shown in brackets).

**Notes to Table 5.10.1.1.:**

(1) See Appendix A.

**5.10.2. Windows, Doors and Skylights****5.10.2.1. General**

- 1)** This Subsection applies to windows, doors and skylights, including their components, that separate
  - a) interior space from exterior space, or
  - b) environmentally dissimilar interior spaces.
- 2)** For the purpose of this Subsection, the term “skylight” refers to unit skylights, roof windows and tubular daylighting devices.
- 3)** Where a wired glass assembly is installed in a required *fire separation*, it need not conform to the requirements of this Subsection. (See Appendix A.)

**5.10.2.2. Applicable Standards**

(See Appendix A.)

- 1)** Windows, doors and skylights shall conform to the requirements in
  - a) AAMA/WDMA/CSA 101/I.S.2/A440, “NAFS – North American Fenestration Standard/Specification for Windows, Doors, and Skylights,” and
  - b) CSA A440S1, “Canadian Supplement to AAMA/WDMA/CSA 101/I.S.2/A440, NAFS – North American Fenestration Standard/Specification for Windows, Doors, and Skylights.”
- 2)** Performance grades for windows, doors and skylights shall be selected according to the Canadian Supplement referenced in Clause (1)(b) so as to be appropriate for the conditions and geographic location in which the window, door or skylight will be installed.
- 3)** Windows, doors and skylights shall conform to the performance grades selected in Sentence (2) when tested in accordance with the Harmonized Standard referenced in Clause (1)(a).

**5.10.2.3. Structural Loads, Air Leakage and Water Penetration**

- 1)** Windows, doors, skylights and their components shall be designed and constructed in accordance with
  - a) Article 5.1.4.1., Section 5.4. and Section 5.6., or
  - b) Article 5.10.2.2., where they are covered in the scope of the standards listed in Sentence 5.10.2.2.(1).

**5.10.2.4. Heat Transfer**

- 1)** Windows, doors and skylights shall meet the heat transfer performance requirements stated in Section 5.3. (See A-5.3.1.2. in Appendix A.)

# **Part 6**

## **Heating, Ventilating and Air-conditioning**

### **Section 6.1. General**

#### **6.1.1. Application**

##### **6.1.1.1. Scope**

- 1) The scope of this Part shall be as described in Subsection 1.3.3. of Division A.

##### **6.1.1.2. Application**

- 1) This Part applies to systems and equipment for heating, ventilating and air-conditioning services.

#### **6.1.2. Definitions**

##### **6.1.2.1. Defined Terms**

- 1) Words that appear in italics are defined in Article 1.4.1.2. of Division A.

#### **6.1.3. Plans and Specifications**

##### **6.1.3.1. Required Plans and Specifications**

- 1) Plans, specifications and other information for heating, ventilating and air-conditioning systems shall conform to Subsection 2.2.6. of Division C.

### **Section 6.2. Design and Installation**

#### **6.2.1. General**

##### **6.2.1.1. Good Engineering Practice**

(See Appendix A.)

- 1) Heating, ventilating and air-conditioning systems, including mechanical refrigeration equipment, shall be designed, constructed and installed in conformance with good engineering practice such as that described in, but not limited to,
  - a) the ASHRAE Handbooks and Standards,
  - b) the HRAI Digest,
  - c) the Hydronics Institute Manuals,
  - d) the NFPA Standards,
  - e) the SMACNA Manuals,
  - f) the Industrial Ventilation Manual published by the ACGIH,
  - g) CSA B214, "Installation Code for Hydronic Heating Systems,"
  - h) CAN/CSA-Z317.2, "Special Requirements for Heating, Ventilation, and Air-Conditioning (HVAC) Systems in Health Care Facilities,"
  - i) EPA 625/R-92/016, "Radon Prevention in the Design and Construction of Schools and Other Large Buildings."

**6.2.1.2. Fire Safety Requirements**

- 1) The fire safety characteristics of heating, ventilating and air-conditioning systems shall comply with Subsection 3.6.5.
- 2) Characteristics referred to in Sentence (1) include but are not limited to
  - a) use of *combustible* materials in duct systems,
  - b) *flame-spread ratings* and smoke-developed ratings of duct and pipe materials and coverings,
  - c) installation of equipment relative to property lines, and
  - d) requirements for *fire dampers* and *fire stop flaps*.

**6.2.1.3. Structural Movement**

(See Appendix A.)

- 1) Mechanical systems and equipment shall be designed and installed to accommodate the maximum relative structural movement provided for in the construction of the *building*. (See Sentence 4.1.3.3.(2), Article 4.1.3.5. and Subsection 4.1.8. for information on the types of structural movements that may be encountered.)

**6.2.1.4. Installation Standards**

- 1) Except as provided in Articles 6.2.1.5. and 6.2.1.6., the installation of heating and air-conditioning equipment, including mechanical refrigeration equipment, and including provisions for mounting, clearances and air supply, shall conform to appropriate provincial or territorial requirements or, in the absence of such requirements, to the requirements of
  - a) CSA B51, "Boiler, Pressure Vessel, and Pressure Piping Code,"
  - b) CSA B52, "Mechanical Refrigeration Code,"
  - c) CSA B139, "Installation Code for Oil-Burning Equipment,"
  - d) CSA B149.1, "Natural Gas and Propane Installation Code,"
  - e) CSA B365, "Installation Code for Solid-Fuel-Burning Appliances and Equipment," or
  - f) CSA C22.1, "Canadian Electrical Code, Part I."

**6.2.1.5. Fireplaces**

- 1) Fireplaces shall conform to the requirements of Section 9.22.

**6.2.1.6. Heat Recovery Ventilators**

- 1) Heat recovery ventilators with rated capacities of not less than 25 L/s and not more than 200 L/s shall be installed in accordance with Subsection 9.32.3.

**6.2.1.7. Outdoor Design Conditions**

- 1) The outdoor conditions to be used in designing heating, ventilating and air-conditioning systems shall be determined in conformance with Subsection 1.1.3.
  - 2) Except as provided in Sentence 6.2.2.4.(1), the outdoor air quality conditions of the geographic area of the *building* site to be used in designing ventilation systems shall conform to appropriate provincial or territorial requirements or, in the absence of such requirements, shall be equal to or less than the maximum acceptable levels stated in the National Ambient Air Quality Objectives of the Canadian Environmental Protection Act as follows:
    - a) 70 µg/m<sup>3</sup> annually and 120 µg/m<sup>3</sup> daily for particulate matter that is 10 µm or less in diameter (PM<sub>10</sub>),
    - b) 15 ppb annually, 25 ppb daily, and 82 ppb hourly for ground-level ozone, and
    - c) 13 ppm (15 mg/m<sup>3</sup>) in eight hours and 30 ppm (35 mg/m<sup>3</sup>) hourly for carbon monoxide (CO), where 1 ppm = 1.146 mg CO/m<sup>3</sup>.
- (See Appendix A.)

**6.2.1.8. Installation – General**

- 1) Equipment requiring periodic maintenance and forming part of a heating, ventilating or air-conditioning system shall be installed with provision for access for inspection, maintenance, repair and cleaning. (See Appendix A.)
- 2) Mechanical equipment shall be provided with guards so as to prevent injury.
- 3) Heating, ventilating or air-conditioning systems shall be protected from freezing if they may be adversely affected by freezing temperatures.

**6.2.1.9. Expansion, Contraction and System Pressure**

- 1) Heating and cooling systems shall be designed to allow for expansion and contraction of the heat transfer fluid and to maintain the system pressure within the rated working pressure limits of all components of the system.

**6.2.1.10. Asbestos**

- 1) Asbestos shall not be used in air distribution systems or equipment in a form or in a location where asbestos fibres could enter the air supply or return systems.

**6.2.1.11. Access Openings**

- 1) Any covering of an access opening through which a person could enter shall be openable from the inside without the use of keys where there is a possibility of the opening being accidentally closed while the system or equipment is being serviced.

**6.2.2. Ventilation****6.2.2.1. Required Ventilation**

- 1) Except as provided in Sentence (3), all *buildings* shall be ventilated in accordance with this Part.
- 2) Except in *storage garages* covered by Article 6.2.2.3., the rates at which outdoor air is supplied in *buildings* by ventilation systems shall be not less than the rates required by ANSI/ASHRAE 62, "Ventilation for Acceptable Indoor Air Quality" (except Addendum n).
- 3) Self-contained mechanical ventilation systems serving only one *dwelling unit* shall comply with
  - a) this Part, or
  - b) Subsection 9.32.3.

**6.2.2.2. Natural Ventilation**

- 1) Except as permitted by Sentence (2), the ventilation required by Article 6.2.2.1. shall be provided by mechanical ventilation, except that it can be provided by natural ventilation or a combination of natural and mechanical ventilation in
  - a) *buildings* of other than *residential occupancy* having an *occupant load* of not more than one person per 40 m<sup>2</sup> during normal use,
  - b) *buildings* of *industrial occupancy* where the nature of the processes contained therein permits or requires the use of large openings in the *building* envelope even during the winter, and
  - c) seasonal *buildings* not intended to be occupied during the winter.
- 2) Where climatic conditions permit, *buildings* containing *occupancies* other than *residential occupancies* may be ventilated by natural ventilation methods in lieu of mechanical ventilation where engineering data demonstrates that such a method will provide the required ventilation for the type of *occupancy*.

**6.2.2.3. Ventilation of Storage Garages**

**1)** Except as provided in Sentences (4) and (6), an enclosed *storage garage* shall have a mechanical ventilation system designed to

- limit the concentration of carbon monoxide to not more than 100 parts per million parts of air,
- limit the concentration of nitrogen dioxide to not more than 3 parts per million parts of air, where the majority of the vehicles stored are powered by diesel-fuelled engines, or
- provide, during operating hours, a continuous supply of outdoor air at a rate of not less than 3.9 L/s for each square metre of *floor area* (see Article 3.3.1.20.).

(See also Sentence 3.3.5.4.(4).)

**2)** Mechanical ventilation systems provided in accordance with Clause (1)(a) shall be controlled by carbon monoxide monitoring devices, and systems provided in accordance with Clause (1)(b) shall be controlled by nitrogen dioxide or other acceptable monitoring devices. (See Appendix A.)

**3)** Mechanical ventilation systems provided in accordance with Sentence (1) shall be designed such that the pressure in the *storage garage* is less than the pressure in adjoining *buildings* of other *occupancy*, or in adjacent portions of the same *building* having a different *occupancy*.

**4)** In *storage garages* subject to the requirements of Sentences (1) and (2), where motor vehicles are parked by mechanical means, the ventilation requirements may be reduced by one half.

**5)** Except as provided in Sentence (6), ticket and attendant booths of *storage garages* shall be pressurized with a supply of uncontaminated air.

**6)** The requirements of Sentences (1) to (5) shall not apply to *open-air storeys* in a *storage garage*.

**6.2.2.4. Cleaning Devices**

**1)** Where outdoor air quality conditions do not meet the requirements of Sentence 6.2.1.7.(2), ventilation required by Sentence 6.2.2.1.(1) shall be provided by a ventilation system designed to include devices that reduce particles and gases to the maximum acceptable levels described in Sentence 6.2.1.7.(2) prior to the introduction of outdoor air to indoor occupied spaces.

**6.2.2.5. Air Contaminants**

**1)** Air contaminants released within *buildings* shall be removed insofar as possible at their points of origin and shall not be permitted to accumulate in concentrations greater than permitted in the Industrial Ventilation Manual published by the American Conference of Governmental Industrial Hygienists.

**2)** Systems serving spaces that contain sources of contamination and systems serving other occupied parts of the *building* but located in or running through spaces that contain sources of contamination shall be designed in such a manner as to prevent spreading of such contamination to other occupied parts of the *building*.

**3)** Heating, ventilating and air-conditioning systems shall be designed to minimize the growth of micro-organisms. (See Appendix A.)

**6.2.2.6. Hazardous Gases, Dusts or Liquids**

**1)** Except as provided in Subsection 6.2.12., systems serving spaces that contain hazardous gases, dusts or liquids shall be designed, constructed and installed to conform to the requirements of the applicable provincial or territorial regulations or municipal bylaws or, in the absence of such regulations or bylaws, to good engineering practice such as that described in the publications of the National Fire Protection Association and in the NFC. (See Appendix A.)

- b) be designed according to good engineering practice such as that provided in CWC 2009, “Engineering Guide for Wood Frame Construction,” or
- c) be designed according to Part 4 using the loads and deflection and vibration limits specified in
  - i) Part 9, or
  - ii) Part 4.

**2)** Where floor framing is designed in accordance with Clause (1)(b) or (c), and where supporting wall framing and fastenings, or footings, are designed according to Clause (1)(a), the specified *live load* on the floor according to Table 4.1.5.3. shall not exceed 2.4 kPa.

**3)** Location-specific information for structural design, including snow and wind loads and seismic spectral response accelerations, shall be determined according to Subsection 1.1.3.

**9.4.2. Specified Loads**

**9.4.2.1. Application**

**1)** This Subsection applies to light-frame constructions whose wall, floor and roof planes are generally comprised of frames of small repetitive structural members, and where

- a) the roof and wall planes are clad, sheathed or braced on at least one side,
- b) the small repetitive structural members are spaced not more than 600 mm o.c.,
- c) the clear span of any structural member does not exceed 12.2 m,
- d) the maximum deflection of the structural roof members conforms to Article 9.4.3.1.,
- e) the maximum total roof area, notwithstanding any separation of adjoining *buildings* by *firewalls*, is 4 550 m<sup>2</sup>, and
- f) for flat roofs, there are no significant obstructions on the roof, such as parapet walls, spaced closer than the distance calculated by

$$D_o = 10 (H_o - 0.8S_s/\gamma)$$

where

- D<sub>o</sub> = minimum distance between obstructions, m,
- H<sub>o</sub> = height of the obstruction above the roof, m,
- S<sub>s</sub> = ground snow load, kPa, and
- γ = unit weight of snow, kN/m<sup>3</sup>.

**9.4.2.2. Specified Snow Loads**

(See Appendix A.)

**1)** Except as provided in Sentences (2) and (3), specified snow loads shall be not less than those calculated using the following formula:

$$S = C_b S_s + S_r$$

where

- S = specified snow load,
- C<sub>b</sub> = basic snow load roof factor, which is 0.45 where the entire width of the roof does not exceed 4.3 m and 0.55 for all other roofs,
- S<sub>s</sub> = 1-in-50-year ground snow load in kPa, determined according to Subsection 1.1.3., and
- S<sub>r</sub> = associated 1-in-50-year rain load in kPa, determined according to Subsection 1.1.3.

**2)** In no case shall the specified snow load be less than 1 kPa.

**3)** Bow string, arch or semi-circular roof trusses having an unsupported span greater than 6 m shall be designed in conformance with the snow load requirements in Subsection 4.1.6.

**9.4.2.3. Platforms Subject to Snow and Occupancy Loads**

**1)** Balconies, decks and other accessible exterior platforms intended for an *occupancy* and subject to snow loads shall be designed to carry the specified roof snow load or 1.9 kPa, whichever is greater, where the platform, or each segregated area of the platform, serves a single *dwelling unit*. (See Appendix A.)

**9.4.2.4. Attics and Roof Spaces**

**1)** The ceiling joists or truss bottom chords in residential *attic or roof spaces* having limited accessibility that precludes the storage of equipment or material shall be designed for a total specified load of not less than 0.35 kPa, where the total specified load is the sum of the specified *dead load* plus the specified *live load* of the ceiling. (See Appendix A.)

**9.4.3. Deflections**

**9.4.3.1. Deflections**

- 1)** The maximum deflection of structural members shall conform to Table 9.4.3.1.
- 2)** *Dead loads* need not be considered in computing deflections referred to in Sentence (1).

**Table 9.4.3.1.**  
**Maximum Deflections**  
Forming Part of Sentence 9.4.3.1.(1)

Structural Members	Type of Ceiling Supported	Max. Allowable Deflection as an Expressed Ratio of the Clear Span
Roof rafters, roof joists and roof beams	No ceiling	1/180
	Other than plaster or gypsum board	1/240
	Plaster or gypsum board	1/360
Ceiling joists	Other than plaster or gypsum board	1/240
	Plaster or gypsum board	1/360
Floor beams, floor joists and floor decking	All cases	1/360
Beams, joists and decking for balconies, decks and other accessible exterior platforms	Serving a single <i>dwelling unit</i>	1/240
	Other	1/360

**9.4.4. Foundation Conditions**

**9.4.4.1. Allowable Bearing Pressures**

- 1)** Footing sizes for *shallow foundations* shall be
  - a) determined in accordance with Section 9.15., or
  - b) designed in accordance with Section 4.2. using
    - i) the maximum allowable bearing pressures in Table 9.4.4.1., or
    - ii) allowable bearing pressures determined from *subsurface investigation*.

- b) is normal weight,
- c) is placed directly on the subflooring, and
- d) has not less than 20 MPa compressive strength after 28 days.

**3)** Where a floor is required to support a concrete topping not more than 51 mm thick, the allowable beam spans shown in Tables A-8 to A-11 shall be multiplied by 0.8 or the supported length of the floor joists shall be reduced to allow for the loads due to the topping.

#### **9.23.4.5. Heavy Roofing Materials**

**1)** Where a roof is required to support an additional uniform *dead load* from roofing materials such as concrete roofing tile, or materials other than as specified in Section 9.27., such as clay roofing tiles, the additional load shall be allowed for by reducing

- a) the spans for roof joists and rafters in Tables A-4 to A-7, or the spacing of the members, and
  - b) the spans for ridge beams and lintels in Tables A-12 to A-16.
- (See A-9.23.4.2. in Appendix A.)

#### **9.23.5. Notching and Drilling**

##### **9.23.5.1. Holes Drilled in Framing Members**

**1)** Holes drilled in roof, floor or ceiling framing members shall be not larger than one-quarter the depth of the member and shall be located not less than 50 mm from the edges, unless the depth of the member is increased by the size of the hole.

##### **9.23.5.2. Notching of Framing Members**

**1)** Floor, roof and ceiling framing members are permitted to be notched provided the notch is located on the top of the member within half the joist depth from the edge of bearing and is not deeper than one-third the joist depth, unless the depth of the member is increased by the size of the notch.

##### **9.23.5.3. Wall Studs**

**1)** Wall studs shall not be notched, drilled or otherwise damaged so that the undamaged portion of the stud is less than two-thirds the depth of the stud if the stud is *loadbearing* or 40 mm if the stud is *non-loadbearing*, unless the weakened studs are suitably reinforced.

##### **9.23.5.4. Top Plates**

**1)** Top plates in walls shall not be notched, drilled or otherwise weakened to reduce the undamaged width to less than 50 mm unless the weakened plates are suitably reinforced.

##### **9.23.5.5. Roof Trusses**

**1)** Roof truss members shall not be notched, drilled or otherwise weakened unless such notching or drilling is allowed for in the design of the truss.

#### **9.23.6. Anchorage**

##### **9.23.6.1. Anchorage of Building Frames**

**1)** Except as required by Sentence 9.23.6.3.(1), *building* frames shall be anchored to the *foundation* unless a structural analysis of wind and earthquake pressures shows anchorage is not required.

- 2)** Except as provided in Sentences (3) and (5), anchorage shall be provided by
  - a) embedding the ends of the first floor joists in concrete, or
  - b) fastening the sill plate to the *foundation* with not less than 12.7 mm diam anchor bolts spaced not more than 2.4 m o.c.

**3)** For *buildings* with 2 or more floors supported by frame walls that are in areas where the seismic spectral response acceleration,  $S_a(0.2)$ , is equal to or greater than 0.70 but not greater than 1.2 or the 1-in-50 hourly wind pressure is equal to or greater than 0.80 kPa but not greater than 1.20 kPa, anchorage shall be provided by fastening the sill plate to the *foundation* with not less than two anchor bolts per *braced wall panel*, where all anchor bolts used are

- a) not less than 15.9 mm in diameter, located within 0.5 m of the end of the *foundation*, and spaced not more than 2.4 m o.c. or
- b) not less than 12.7 mm in diameter, located within 0.5 m of the end of the *foundation*, and spaced not more than 1.7 m o.c.

**4)** Anchor bolts referred to in Sentences (2) and (3) shall be

- a) fastened to the sill plate with nuts and washers,
- b) embedded not less than 100 mm in the *foundation*, and
- c) so designed that they may be tightened without withdrawing them from the *foundation*.

**5)** Where the seismic spectral response acceleration,  $S_a(0.2)$ , is greater than 1.2 or the 1-in-50 hourly wind pressure is equal to or greater than 1.2 kPa, anchorage shall be designed according to Part 4.

### 9.23.6.2. Anchorage of Columns and Posts

**1)** Except as provided in Sentences (2) and (3), exterior columns and posts shall be anchored to resist uplift and lateral movement.

**2)** Except as provided in Sentence (3), where columns or posts support balconies, decks, verandas or other exterior platforms, and the distance from finished ground to the underside of the joists is not more than 600 mm,

- a) the columns or posts shall be anchored to the *foundation* to resist uplift and lateral movement, or
- b) the supported joists or beams shall be directly anchored to the ground to resist uplift.

**3)** Anchorage is not required for platforms described in Sentence (2) that

- a) are not more than 1 *storey* in height,
- b) are not more than 55 m<sup>2</sup> in area,
- c) do not support a roof, and
- d) are not attached to another structure, unless it can be demonstrated that differential movement will not adversely affect the performance of the structure to which the platform is attached.

### 9.23.6.3. Anchorage of Smaller Buildings

**1)** *Buildings* not more than 4.3 m wide and not more than 1 *storey* in *building height* that are not anchored in accordance with Sentence 9.23.6.1.(1) shall be anchored in conformance with the requirements of CSA Z240.10.1, "Site Preparation, Foundation, and Anchorage of Manufactured Homes."

## 9.23.7. Sill Plates

### 9.23.7.1. Size of Sill Plates

**1)** Where sill plates provide bearing for the floor system, they shall be not less than 38 mm by 89 mm material.

### 9.23.7.2. Levelling and Sealing of Sill Plates

**1)** Sill plates shall be

- a) levelled by setting them on a full bed of mortar, or
- b) laid directly on the *foundation* if the top of the *foundation* is level.

(See also Article 9.23.2.3.)

**2)** The joint between the sill plate for exterior walls and the *foundation* shall be sealed in accordance with Subsection 9.25.3.

**9.23.15.4. Direction of Installation**

- 1)** Plywood subflooring shall be installed with the surface grain at right angles to the joists and with joints parallel to floor joists staggered.
- 2)** OSB subflooring conforming to CSA O325 or to O-1 and O-2 grades in CSA O437.0, "OSB and Waferboard," and waferboard subflooring conforming to R-1 grade in CSA O437.0 shall be installed so that the direction of face orientation is at right angles to the joists and the joints parallel to the floor joists are staggered. (See Appendix A.)

**9.23.15.5. Subfloor Thickness or Rating**

- 1)** Except as provided in Sentences (2) and (3), subfloors shall conform to either Table 9.23.15.5.A. or Table 9.23.15.5.B.

**Table 9.23.15.5.A.  
Thickness of Subflooring**  
Forming Part of Sentences 9.23.15.5.(1) and 9.23.16.7.(1)

Maximum Spacing of Supports, mm	Minimum Thickness, mm			
	Plywood and OSB, O-2 Grade	OSB, O-1 Grade, and Waferboard, R-1 Grade	Particleboard	Lumber
400	15.5	15.9	15.9	17.0
500	15.5	15.9	19.0	19.0
600	18.5	19.0	25.4	19.0

**Table 9.23.15.5.B.  
Rating for Subfloor when Applying CSA O325**  
Forming Part of Sentences 9.23.15.5.(1) and 9.23.16.7.(1)

Maximum Spacing of Supports, mm	Panel Mark	
	Subfloor	Used with Panel-Type Underlay
400	1F16	2F16
500	1F20	2F20
600	1F24	2F24

- 2)** Where the finished flooring consists of not less than 19 mm matched wood strip flooring laid at right angles to joists spaced not more than 600 mm o.c., subflooring shall be permitted to consist of not less than
  - a) 12.5 mm thick plywood,
  - b) 12.5 mm thick OSB conforming to O-2 grade,
  - c) 12.7 mm thick OSB conforming to O-1 grade,
  - d) 12.7 mm thick waferboard conforming to R-1 grade, or
  - e) OSB conforming to 2R32/2F16 grade.
- 3)** Except where the flooring consists of ceramic tiles applied with adhesive, where a separate panel-type underlay or concrete topping is applied to a subfloor on joists spaced not more than 400 mm o.c., the subfloor is permitted to consist of not less than
  - a) 12.5 mm thick plywood,
  - b) 12.5 mm thick OSB conforming to O-2 grade,
  - c) 12.7 mm thick OSB conforming to O-1 grade,
  - d) 12.7 mm thick waferboard conforming to R-1 grade, or
  - e) OSB conforming to 2R32/2F16 grade.

**9.23.15.6. Annular Grooved Nails**

- 1)** When resilient flooring is applied directly to an OSB, waferboard, particleboard or plywood subfloor, the subfloor shall be fastened to the supports with annular grooved nails.

**9.23.15.7. Lumber Subflooring**

- 1) Lumber subflooring shall be laid at an angle of not less than 45° to the joists.
- 2) Lumber subflooring shall be fully supported at the ends on solid bearing.
- 3) Lumber for subflooring shall be of uniform thickness and not more than 184 mm wide.

**9.23.16. Roof Sheathing****9.23.16.1. Required Roof Sheathing**

1) Except where the 1-in-50 hourly wind pressure is less than 0.8 kPa and the seismic spectral response acceleration,  $S_a(0.2)$ , is less than or equal to 0.70, continuous lumber or panel-type roof sheathing shall be installed to support the roofing.

**9.23.16.2. Material Standards**

- 1) Wood-based panels used for roof sheathing shall conform to the requirements of
  - a) CSA O121, "Douglas Fir Plywood,"
  - b) CSA O151, "Canadian Softwood Plywood,"
  - c) CSA O153-M, "Poplar Plywood,"
  - d) CSA O325 or
  - e) CSA O437.0, "OSB and Waferboard."

**9.23.16.3. Direction of Installation**

- 1) Plywood roof sheathing shall be installed with the surface grain at right angles to the roof framing.
- 2) OSB roof sheathing conforming to CSA O325 or to O-1 and O-2 grades as specified in CSA O437.0, "OSB and Waferboard," shall be installed with the direction of face orientation at right angles to the roof framing members. (See A-9.23.15.4.(2) in Appendix A.)

**9.23.16.4. Joints in Panel-Type Sheathing**

- 1) Panel-type sheathing board shall be applied so that joints perpendicular to the roof ridge are staggered where
  - a) the sheathing is applied with the surface grain parallel to the roof ridge, and
  - b) the thickness of the sheathing is such that the edges are required to be supported.
- 2) A gap of not less than 2 mm shall be left between sheets of plywood, OSB or waferboard.

**9.23.16.5. Lumber Roof Sheathing**

- 1) Lumber roof sheathing shall not be more than 286 mm wide and shall be applied so that all ends are supported with end joints staggered.
- 2) Lumber roof sheathing shall be installed diagonally, where
  - a) the seismic spectral response acceleration,  $S_a(0.2)$ , is greater than 0.70 but not greater than 1.2, or
  - b) the 1-in-50 hourly wind pressure is equal to or greater than 0.80 kPa but less than 1.20 kPa.
- 3) Lumber roof sheathing shall be designed according to Part 4, where
  - a) the seismic spectral response acceleration,  $S_a(0.2)$ , is greater than 1.2, or
  - b) the 1-in-50 hourly wind pressure is equal to or greater than 1.20 kPa.

**9.23.16.6. Edge Support**

1) Where panel-type roof sheathing requires edge support, the support shall consist of metal H clips or not less than 38 mm by 38 mm blocking securely nailed between framing members.

**9.25.5.2. Position of Low Permeance Materials**

(See Appendix A.)

- 1)** Sheet and panel-type materials described in Article 9.25.5.1. shall be installed
  - a) on the warm face of the assembly (see also Article 9.25.4.2.),
  - b) at a location where the ratio between the total thermal resistance of all materials outboard of its innermost impermeable surface and the total thermal resistance of all materials inboard of that surface is not less than that required by Table 9.25.5.2., or
  - c) outboard of an air space that is vented to the outdoors.
- 2)** For walls, the air space described in Clause (1)(c) shall comply with Clause 9.27.2.2.(1)(a).

**Table 9.25.5.2.**  
**Ratio of Outboard to Inboard Thermal Resistance**  
 Forming Part of Sentence 9.25.5.2.(1)

Heating Degree-Days of <i>Building Location</i> <sup>(1)</sup> , Celsius degree-days	Minimum Ratio of Total Thermal Resistance Outboard of Material's Inner Surface to Total Thermal Resistance Inboard of Material's Inner Surface
up to 4 999	0.20
5 000 to 5 999	0.30
6 000 to 6 999	0.35
7 000 to 7 999	0.40
8 000 to 8 999	0.50
9 000 to 9 999	0.55
10 000 to 10 999	0.60
11 000 to 11 999	0.65
12 000 or higher	0.75

**Notes to Table 9.25.5.2.:**

(1) See Sentence 1.1.3.1.(1).

**Section 9.26. Roofing**

**9.26.1. General**

**9.26.1.1. Purpose of Roofing**

- 1)** Roofs shall be protected with roofing, including flashing, installed to shed rain effectively and prevent water due to ice damming from entering the roof.
- 2)** For the purpose of Sentence (1), roofs shall include platforms that effectively serve as roofs with respect to the accumulation or drainage of precipitation. (See Appendix A.)

**9.26.1.2. Alternate Installation Methods**

- 1)** Methods described in CAN3-A123.51-M, "Asphalt Shingle Application on Roof Slopes 1:3 and Steeper," or CAN3-A123.52-M, "Asphalt Shingle Application on Roof Slopes 1:6 to Less Than 1:3," are permitted to be used for asphalt shingle applications not described in this Section.

**9.26.2. Roofing Materials**

**9.26.2.1. Material Standards**

- 1)** Roofing materials shall conform to
  - a) CAN/CGSB-37.4-M, "Fibrated, Cutback Asphalt, Lap Cement for Asphalt Roofing,"

- b) CAN/CGSB-37.5-M, "Cutback Asphalt Plastic, Cement,"
- c) CAN/CGSB-37.8-M, "Asphalt, Cutback, Filled, for Roof Coating,"
- d) CGSB 37-GP-9Ma, "Primer, Asphalt, Unfilled, for Asphalt Roofing, Dampproofing and Waterproofing,"
- e) CGSB 37-GP-21M, "Tar, Cutback, Fibrated, for Roof Coating,"
- f) CAN/CGSB-37.50-M, "Hot-Applied, Rubberized Asphalt for Roofing and Waterproofing,"
- g) CGSB 37-GP-52M, "Roofing and Waterproofing Membrane, Sheet Applied, Elastomeric,"
- h) CAN/CGSB-37.54, "Polyvinyl Chloride Roofing and Waterproofing Membrane,"
- i) CGSB 37-GP-56M, "Membrane, Modified, Bituminous, Prefabricated, and Reinforced for Roofing,"
- j) CGSB 41-GP-6M, "Sheets, Thermosetting Polyester Plastics, Glass Fiber Reinforced,"
- k) CAN/CGSB-51.32-M, "Sheathing, Membrane, Breather Type,"
- l) CSA A123.1/A123.5, "Asphalt Shingles Made From Organic Felt and Surfaced with Mineral Granules/Asphalt Shingles Made From Glass Felt and Surfaced with Mineral Granules,"
- m) CAN/CSA-A123.2, "Asphalt-Coated Roofing Sheets,"
- n) CSA A123.3, "Asphalt Saturated Organic Roofing Felt,"
- o) CAN/CSA-A123.4, "Asphalt for Constructing Built-Up Roof Coverings and Waterproofing Systems,"
- p) CSA A123.17, "Asphalt Glass Felt Used in Roofing and Waterproofing,"
- q) CAN/CSA-A220 Series, "Concrete Roof Tiles,"
- r) CSA O118.1, "Western Red Cedar Shakes and Shingles," or
- s) CSA O118.2, "Eastern White Cedar Shingles."

### 9.26.2.2. Nails

- 1) Nails used for roofing shall be corrosion-resistant roofing or shingle nails conforming to
  - a) ASTM F 1667, "Driven Fasteners: Nails, Spikes, and Staples," or
  - b) CSA B111, "Wire Nails, Spikes and Staples."
- 2) Nails shall have sufficient length to penetrate through, or 12 mm into, roof sheathing.
- 3) Nails used with asphalt roofing shall have a head diameter of not less than 9.5 mm and a shank thickness of not less than 2.95 mm.
- 4) Nails used with wood shingles or shakes shall have a head diameter of not less than 4.8 mm and a shank thickness of not less than 2.0 mm and shall be stainless steel, aluminum or hot-dipped galvanized. (See Appendix A.)

### 9.26.2.3. Staples

- 1) Staples used to apply asphalt or wood shingles shall be corrosion-resistant and shall be driven with the crown parallel to the eaves.
- 2) Staples used with asphalt shingles shall be not less than 19 mm long, 1.6 mm diam or thickness, with not less than a 25 mm crown, except that an 11 mm crown may be used as provided in Sentence 9.26.7.4.(2).
- 3) Staples used with wood shingles shall be not less than 29 mm long, 1.6 mm diam or thickness, with not less than a 9.5 mm crown and shall be stainless steel or aluminum. (See A-9.26.2.2.(4) in Appendix A.)

## 9.26.3. Slope of Roofed Surfaces

### 9.26.3.1. Slope

- 1) Except as provided in Sentences (2) and (3), the slopes on which roof coverings may be applied shall conform to Table 9.26.3.1.

5) The roofing membranes shall be carried over the edge of the roof before the gravel stop referred to in Sentence (4) is fastened and 2 plies of roofing membrane mopped to the top surface of the gravel stop before the flood coat is applied.

6) The gravel stop referred to in Sentence (4) shall extend over the edge of the roof to form a drip or shall be flashed so that the flashing extends over the edge to form a drip.

## **9.26.12. Selvage Roofing**

### **9.26.12.1. Coverage**

1) Wide selvage asphalt roofing shall provide double coverage over the entire roof surface.

### **9.26.12.2. Joints**

1) Plies of selvage roofing shall be cemented together to ensure a watertight joint.

## **9.26.13. Sheet Metal Roofing**

### **9.26.13.1. Thickness**

- 1) Sheet metal roofing shall be not less than
- 0.33 mm thick galvanized steel,
  - 0.46 mm thick copper,
  - 0.46 mm thick zinc, or
  - 0.48 mm thick aluminum.

### **9.26.13.2. Support**

1) Except as provided in Sentence 9.23.16.1.(1), where sheet metal roofing is not supported by roof decking but spans between spaced supports, the panels shall be designed to support the specified *live loads* for roofs.

## **9.26.14. Glass Reinforced Polyester Roofing**

### **9.26.14.1. Support**

1) Except as provided in Sentence 9.23.16.1.(1), where glass-reinforced polyester roofing panels are not supported by roof decking but span between spaced supports, the panels shall be designed to support the specified live roof loads.

## **9.26.15. Hot Applied Rubberized Asphalt Roofing**

### **9.26.15.1. Installation**

1) Hot applied rubberized asphalt roofing shall be installed in accordance with CAN/CGSB-37.51-M, "Application for Hot-Applied Rubberized Asphalt for Roofing and Waterproofing."

## **9.26.16. Polyvinyl Chloride Sheet Roofing**

### **9.26.16.1. Installation**

1) Polyvinyl chloride sheet applied roofing membrane shall be installed in accordance with CGSB 37-GP-55M, "Application of Sheet Applied Flexible Polyvinyl Chloride Roofing Membrane."

**9.26.17. Concrete Roof Tiles****9.26.17.1. Installation**

1) Except as provided in Sentence 9.23.16.1.(1), concrete roof tiles shall be installed according to CAN/CSA-A220 Series, "Concrete Roof Tiles." (See Appendix A.)

**9.26.18. Roof Drains and Downspouts****9.26.18.1. Roof Drains**

1) When roof drains are provided they shall conform to Part 7.

**9.26.18.2. Downspouts**

1) Where downspouts are provided and are not connected to a sewer, extensions shall be provided to carry rainwater away from the *building* in a manner which will prevent *soil* erosion.

**Section 9.27. Cladding****9.27.1. Application****9.27.1.1. General**

1) Where lumber, wood shingles, shakes, fibre-cement shingles, planks and sheets, plywood, OSB, waferboard, hardboard, vinyl, aluminum or steel, including trim and soffits, are installed as cladding on wood-frame walls exposed to precipitation, the cladding assembly shall comply with

- a) Subsections 9.27.2. to 9.27.12., or
- b) Part 5.

2) Where stucco is installed as cladding on wood-frame or masonry walls exposed to precipitation, the cladding assembly shall comply with

- a) Subsections 9.27.2. to 9.27.4., and Section 9.28., or
- b) Part 5.

3) Where masonry serves as cladding on wood-frame or masonry walls exposed to precipitation, the cladding assembly shall comply with

- a) Subsections 9.27.2. to 9.27.4., and Section 9.20., or
- b) Part 5.

4) Where asphalt shingles are installed as cladding on wood-frame walls exposed to precipitation, the cladding assembly shall comply with

- a) Subsections 9.26.7. and 9.27.2. to 9.27.4., or
- b) Part 5.

5) Where cladding materials other than those described in Sentences (1) to (4) are installed, or where the cladding materials described in Sentences (1) to (4) are installed on substrates other than those identified in Sentences (1) to (4), the materials and installation shall comply with Part 5.

**9.27.2. Required Protection from Precipitation**

(See Appendix A.)

**9.27.2.1. Minimizing and Preventing Ingress and Damage**

1) Except where exterior walls are protected from precipitation or where it can be shown that precipitation ingress will not adversely affect occupant health or safety, exterior walls shall be designed and constructed to

- a) minimize the ingress of precipitation into the assembly, and
- b) prevent the ingress of precipitation into interior space.

(See Appendix A.)

**Table 9.36.3.10. (Continued)**

**Notes to Table 9.36.3.10.:**

- (1) The symbols and abbreviations that appear in this column have the following meanings:
  - AFUE = annual fuel utilization efficiency
  - COP = coefficient of performance, in W/W (COP<sub>c</sub> = in cooling mode and COP<sub>h</sub> = in heating mode)
  - E<sub>c</sub> = combustion efficiency, in %
  - EER = energy efficiency ratio, in (Btu/h)/W (no metric equivalent)
  - E<sub>t</sub> = thermal efficiency
  - FE = fireplace efficiency
  - HSPF = heating season performance factor, in watt-hours
  - ICOP = integrated coefficient of performance, in W/W
  - OTPF = overall thermal performance factor
  - SEER = seasonal energy efficiency ratio, in (Btu/h)/W (no metric equivalent)
  - TPF = thermal performance factor
- (2) No standard addresses the performance efficiency of electric *boilers*; however, their efficiency typically approaches 100%.
- (3) Includes propane.
- (4) See the exception stated in Sentence (3).
- (5) See Sentence (2).
- (6) CSA B415.1 does not apply to *stoves* with an oven whose volume is greater than 0.028 m<sup>3</sup> and automatically fuelled *appliances*.
- (7) Minimum performance values are omitted from the Table in cases where the referenced standard itself contains such requirements.

- 2)** Natural gas and propane fireplaces shall be
  - a) direct-vent (sealed), and
  - b) pilot-on-demand, interrupted or intermittent ignition systems without a standing pilot light.

**3)** The heat source component of combined space- and service water heating systems that are not within the scope of CAN/CSA-P.9, "Performance of Combined Space and Water Heating Systems (Combos)," shall meet the performance requirements stated in Table 9.36.3.10. for the applicable equipment type. (See Appendix A.)

**9.36.3.11. Solar Thermal Systems**

**1)** Space-heating systems that use solar thermal technology shall conform to the manufacturer's design requirements and installation procedures.

**2)** Service water heating systems that use solar thermal technology shall be installed in accordance with the NPC.

**3)** Hot water storage tanks associated with the systems referred to in Sentence (2) shall be installed in a *conditioned space*.

**9.36.4. Service Water Heating Systems**

**9.36.4.1. Scope and Application**

**1)** This Subsection is concerned with the efficient use of energy by systems used to heat service water for household use as well as for indoor pools and hot tubs.

**2)** Where service water heating equipment or techniques other than those described in this Subsection are used, the *building* shall be designed and constructed in accordance with the energy efficiency requirements of the NECB.

**9.36.4.2. Equipment Efficiency**

**1)** *Service water heaters, boilers, pool heaters and storage tanks* shall comply with the performance requirements stated in Table 9.36.4.2. (See Appendix A.)

**2)** Hot service water storage tanks not listed in Table 9.36.4.2. shall be covered with insulation having a minimum thermal resistance of 1.8 (m<sup>2</sup>·K)/W.

**Table 9.36.4.2.**  
**Service Water Heating Equipment Performance Standards**  
 Forming Part of Sentences 9.36.4.2.(1) and (2)

Component	Input <sup>(1)</sup>	Standard	Performance Requirement <sup>(2)</sup>
<b>Storage-Type Service Water Heaters</b>			
Electric	≤ 12 kW (50 L to 270 L capacity)	CAN/CSA-C191	SL ≤ 35 + 0.20V (top inlet)
			SL ≤ 40 + 0.20V (bottom inlet)

Gas-fired	≤ 73.2 kW	CAN/CSA-P.7	EF ≥ 0.8
	> 73.2 kW	ANSI Z21.10.3/CSA 4.3 and DOE 10 CFR, Part 431, Subpart G	E <sub>t</sub> ≥ 80%
Oil-fired	≤ 61.5 kW <sup>(5)</sup>	DOE 10 CFR, Part 430, Subpart B, Appendix E	EF ≥ 0.59 – 0.0019V <sub>m</sub>
	Other	ANSI Z21.10.3/CSA 4.3 and DOE 10 CFR, Part 431, Subpart G	E <sub>t</sub> ≥ 80%
Electric	—	—	<sup>(6)</sup>
Combined space- and water-heating systems (combos)	≤ 87.9 kW if <i>boiler-based</i> ≤ 73.2 kW if based on <i>service water heater</i>	CAN/CSA-P.9	TPF = 0.65
Integrated mechanical systems	—	CSA P.10	OTPF = 0.78
<b>Pool Heaters</b>			
Gas-fired <sup>(3)</sup>	< 117.2 kW	ANSI Z21.56/CSA 4.7 or CSA P.6	E <sub>t</sub> ≥ 82%
Oil-fired	—	CSA B140.12	E <sub>t</sub> ≥ 75%

**Notes to Table 9.36.4.2.:**

(1) 1 kW = 3412 Btu/h

(2) The symbols and abbreviations used in this column have the following meanings:

- EF = energy factor, in %/h
- E<sub>t</sub> = thermal efficiency with 38.9°C water temperature difference
- OTPF = overall thermal performance factor
- S = standby loss, in %/h (percentage heat content of stored water per hour)
- SL = standby loss, in W
- TPF = thermal performance factor
- V = storage volume, in L, as specified by the manufacturer
- V<sub>m</sub> = measured storage volume, in US gallons

(3) Includes propane.

(4) Rated input is measured in watts.

(5) Consistent with the US Congress National Appliance Energy Conservation Act of 1987.

(6) No standard addresses the performance efficiency of electric tankless *service water heaters*; however, their efficiency typically approaches 100%.

- 5)** Except as stated in Sentence 9.36.5.6.(9), the energy model calculations for the proposed house shall account for the effects of exterior permanent and fixed shading devices, including fins, overhangs, and light shelves, on solar heat gain.
- 6)** Where thermal mass is included in the energy model calculations for the proposed house, it shall be set as
- the specified mass up to the inside edge of insulation in exterior walls, the mass of interior walls, the mass up to the centre-line of *party walls*, and the mass of floors, as applicable,
  - the specified mass of the *building* envelope assembly, where the energy model calculations include a transient analysis of thermal transfer of the entire *building* envelope assembly, or
  - a default value of 0.060 MJ/m<sup>2</sup>·°C.
- 7)** Exterior walls, roofs and exposed floors shall have a solar absorptance of 0.4.
- 8)** The orientation of the *foundation* of the proposed house as constructed shall be within 22.5° of the orientation used in the energy model calculations.
- 9)** The airtightness value used in the energy model calculations for the proposed house shall be
- 3.2 air changes per hour at 50 Pa pressure differential, where the construction complies with Section 9.25.,
  - 2.5 air changes per hour at 50 Pa pressure differential, where it can be shown that the *air barrier system* is constructed in accordance with Subsection 9.25.3. and Articles 9.36.2.9. and 9.36.2.10., or
  - where airtightness is tested in accordance with Sentence (11),
    - the number of air changes per hour at 50 Pa pressure differential, and
    - the equivalent leakage area (see Appendix A).
- 10)** A design airtightness shall be assigned for use in the energy model calculations until the actual airtightness has been measured in accordance with Sentence (11).
- 11)** Where measured airtightness is used in the energy model calculations, it shall be determined in accordance with CAN/CGSB-149.10, "Determination of the Airtightness of Building Envelopes by the Fan Depressurization Method,"
- as written, or
  - excluding Clause 6.1.6, which allows intentional openings for mechanical equipment to be left unsealed.
- (See Appendix A.)
- 12)** Where airtightness is determined in accordance with Sentence (11) using air changes per hour, the result obtained at an air pressure differential of 50 Pa shall be used in the energy model calculations.
- 13)** Where airtightness is determined in accordance with Clause (11)(b), its rate shall be adjusted in the energy model calculations to account for air leakage through mechanical equipment.

#### **9.36.5.11. Modeling HVAC System of Proposed House**

- 1)** Where multiple HVAC systems serve a single space, the energy model calculations for the proposed house shall call each system in the order of priority established by the system control in the proposed house.
- 2)** Where a heat pump is included in the proposed house, the energy model calculations shall include
- the effect of the source temperature on the heat pump's efficiency, and
  - the temperature at which the heat pump shuts down.
- 3)** Permanent supplementary heating systems that are operated by a thermostat or automatic control shall be included in the energy model calculations for the proposed house.

- 4)** The performance characteristics of the heat-recovery ventilation system of the proposed house shall be as specified at not less than the principal ventilation rate required for a system designed in accordance with Section 9.32.
- 5)** The ventilation system shall be modeled as operating 8 hours a day at the principal ventilation rate.
- 6)** The energy model calculations shall determine the required principal ventilation rate, in L/s, in accordance with Article 9.32.3.3. based on the number of bedrooms in the proposed house.
- 7)** The energy model calculations may include duct and piping losses, taking into account the properties of the specified duct and piping insulation of the proposed house.
- 8)** The energy model calculations shall include a heating system and, where installed, a cooling system sized according to the specifications for the proposed house.
- 9)** The energy model calculations shall include the effect of part-load performance of equipment using
  - a) the same modeled part-load performance data used for the reference house as per Clause 9.36.5.15.(6)(a),
  - b) the default part-load performance characteristics stated in Clause 9.36.5.15.(6)(b), or
  - c) measured data for the specified equipment.(See Appendix A.)
- 10)** Where a heat-recovery ventilator is installed in the proposed house, the energy model calculations shall only account for the recovery of sensible heat using the efficiency ratings in Sentence 9.36.3.9.(3). (See Appendix A.)
- 11)** Except as provided in Sentence (12), where a forced-air system is installed in the proposed house, the energy model calculations shall assume the circulation fan operates when the heating, cooling or principal ventilation system is operating. (See Appendix A.)
- 12)** Where a forced-air system is installed in the proposed house and where the principal ventilation system in the proposed house is a separate, fully ducted ventilation system, the energy model calculations shall assume the circulation fan operates only when the heating or cooling system is operating.
- 13)** Where the proposed house contains multiple HVAC systems, the circulation fan power shall be the sum of the circulation fan power capacity of each system.
- 14)** The ventilation fan power consumption shall be modeled
  - a) as being 2.32 W/L/s for each ventilation fan on the exhaust side and, where applicable, on the supply side, or
  - b) as specified, where a heat-recovery ventilator is used.
- 15)** Where a forced-air system is installed in the proposed house, the energy model calculations shall determine the flow rate, in L/s, of the circulation fan in the reference house by multiplying the capacity, in W, of the heating system in the proposed house by
  - a) 0.0604 for heat pumps, and
  - b) 0.0251 for all other types of heating systems.
- 16)** Where a forced-air system is installed in the proposed house, the energy model calculations shall determine the minimum electricity requirement, in W, of the circulation fan by multiplying the flow rate, in L/s, of the circulation fan in the reference house, determined in accordance with Sentence (15), by a factor of 2.30.
- 17)** Where a forced-air system is installed in the proposed house, the flow rate of the circulation fan shall be modeled as being the larger of
  - a) the flow rate of the circulation fan of the reference house, determined in accordance with Sentence (15), or
  - b) the flow rate of the circulation fan for the forced-air system specified in the design for the proposed house.

**13)** Where a heat-recovery ventilator is required in the reference house in accordance with Article 9.36.3.8., the ventilation flow rate, in L/s, in the zone served by the pool or hot tub shall be multiplied by 4.18 W/L/s to determine the heat-recovery ventilator power, in W, to be used in the energy model calculations.

**14)** Where a forced-air system is installed in the reference house, the system's capacity, in W, shall be multiplied by one of the following factors to determine the circulation fan flow rate, in L/s:

- a) 0.0604 for heat pumps, and
- b) 0.0251 for all other types of heating systems.

**15)** Where a forced-air system is installed in the reference house, the circulation fan flow rate, in L/s, shall be multiplied by 2.30 W/L/s to determine the circulation fan power capacity, in W.

**16)** For natural gas-, oil-, propane- and wood-burning heating systems, the energy model calculations shall set the auxiliary electricity capacity, including that of combustion fans, to 208 W during operation.

**9.36.5.16. Modeling Service Water Heating System of Reference House**

**1)** The energy source of the reference house's service water heating system, which is gas, electricity, oil, propane, wood or a heat pump, shall be the same as that for the system in the proposed house.

**2)** The service water heating system in the reference house shall be sized in accordance with Subsection 9.31.6. with regard to output capacity.

**3)** Except as required by Table 9.36.5.16., the performance of the service water heating equipment in the reference house shall be modeled as conforming to Table 9.36.4.2. for the energy source, capacity and type of service water heating equipment in the proposed house.

**Table 9.36.5.16.**  
**Performance of Service Water Heating (SWH) Equipment in the Reference House**  
Forming Part of Sentence 9.36.5.16.(3)

Type of SWH Equipment in Proposed House	Input for Proposed SWH Equipment	Type of SWH Equipment to be Used for Reference House	Input for Reference SWH Equipment
Gas-fired tankless <i>service water heater</i>	≤ 73.2 kW	Gas-fired storage type	≤ 22 kW
	> 73.2 kW		> 22 kW
Oil-fired tankless <i>service water heater</i>	≤ 61.5 kW <sup>(1)</sup>	Oil-fired storage type	≤ 30.5 kW <sup>(1)</sup>
	Other		> 30.5 kW
Not listed in Table 9.36.4.2.	—	Gas-fired storage type	≥ 22 kW (E <sub>i</sub> ≥ 80%)

**Notes to Table 9.36.5.16.:**

<sup>(1)</sup> Consistent with the US Congress National Appliance Energy Conservation Act of 1987.

**Section 9.37. Objectives and Functional Statements**

**9.37.1. Objectives and Functional Statements**

**9.37.1.1. Attributions to Acceptable Solutions**

**1)** For the purpose of compliance with this Code as required in Clause 1.2.1.1.(1)(b) of Division A, the objectives and functional statements attributed to the acceptable solutions in this Part shall be the objectives and functional statements listed in Table 9.37.1.1. (See A-1.1.2.1.(1) in Appendix A.)

**Table 9.37.1.1.**

Table 9.37.1.1. is located in Volume 1, Attribution Tables.

# Appendix A

## Explanatory Material

### **A-1.1.2.1.(1) Objectives and Functional Statements Attributed to Acceptable**

**Solutions.** The objectives and functional statements attributed to each Code provision are shown in Tables at the end of Volume 1.

Many provisions in Division B serve as modifiers of or pointers to other provisions, or serve other clarification or explanatory purposes. In most cases, no objectives and functional statements have been attributed to such provisions, which therefore do not appear in the above-mentioned tables.

For provisions that serve as modifiers of or pointers to other referenced provisions and that do not have any objectives and functional statements attributed to them, the objectives and functional statements that should be used are those attributed to the provisions they reference.

**A-1.1.3.1.(1) Climatic and Seismic Values.** Climatic values for municipalities not listed in Appendix C may be obtained by writing to the Meteorological Service of Canada, Environment Canada, 4905 Dufferin Street, Toronto, Ontario M3H 5T4.

Seismic values for municipalities not listed in Appendix C may be obtained through the Natural Resources Canada Web site at [www.EarthquakesCanada.ca](http://www.EarthquakesCanada.ca), or by writing to the Geological Survey of Canada at 7 Observatory Crescent, Ottawa, Ontario K1A 0Y3, or at P.O. Box 6000, Sidney, B.C. V8L 4B2.

**A-1.1.3.1.(2) Winter Design Temperatures.** The 2.5% values referred to in Sentence 1.1.3.1.(2) are the least restrictive temperatures that can be used. A designer may choose to use the 1% values given in Appendix C, which are in excess of the Code minimums but are considered acceptable.

**A-1.3.1.2.(1) Applicable Editions.** Where documents are referenced in Appendices A, B and C of this Code, they shall be the editions designated in Table A-1.3.1.2.(1).

**Table A-1.3.1.2.(1)**  
**Documents Referenced in Appendices A, B and C of the National Building Code of Canada 2010**

Issuing Agency	Document Number <sup>(1)</sup>	Title of Document <sup>(2)</sup>	Code Reference

**Notes to Table A-1.3.1.2.(1):**

- (1) Some documents may have been reaffirmed or reapproved. Check with the applicable issuing agency for up-to-date information.
- (2) Some titles have been abridged to omit superfluous wording.
- (3) Code reference is in Division A.
- (4) Notwithstanding the effective date stated in Sentence 1.3.1.1.(1), the 2013 edition of NFPA 13 is referenced as it better meets the intent of the Code.

**A-3 Application of Part 3.** In applying the requirements of this Part, it is intended that they be applied with discretion to buildings of unusual configuration that do not clearly conform to the specific requirements, or to buildings in which processes are carried out which make compliance with particular requirements in this Part impracticable. The definition of “building” as it applies to this Code is general and encompasses most structures, including those which would not normally be considered as buildings in the layman's sense. This occurs more often in industrial uses, particularly those involving manufacturing facilities and equipment that require specialized design that may make it impracticable to follow the specific requirements of this Part. Steel mills, aluminum plants, refining, power generation and liquid storage facilities are examples. A water tank or an oil refinery, for example, has no floor area, so it is obvious that requirements for exits from floor areas would not apply. Requirements for structural fire protection in large steel mills and pulp and paper mills, particularly in certain portions, may not be practicable to achieve in terms of the construction normally used and the operations for which the space is to be used. In other portions of the same building, however, it may be quite reasonable to require that the provisions of this Part be applied (e.g., the office portions). Similarly, areas of industrial occupancy which may be occupied only periodically by service staff, such as equipment penthouses, normally would not need to have the same type of exit facility as floor areas occupied on a continuing basis. It is expected that judgment will be exercised in evaluating the application of a requirement in those cases when extenuating circumstances require special consideration, provided the occupants' safety is not endangered.

The provisions in this Part for fire protection features installed in buildings are intended to provide a minimum acceptable level of public safety. It is intended that all fire protection features of a building, whether required or not, will be designed in conformance with good fire protection engineering practice and will meet the appropriate installation requirements in relevant standards. Good design is necessary to ensure that the level of public safety established by the Code requirements will not be reduced by a voluntary installation.

### **Firefighting Assumptions**

The requirements of this Part are based on the assumption that firefighting capabilities are available in the event of a fire emergency. These firefighting capabilities may take the form of a paid or volunteer public fire department or in some cases a private fire brigade. If these firefighting capabilities are not available, additional fire safety measures may be required.

Firefighting capability can vary from municipality to municipality. Generally, larger municipalities have greater firefighting capability than smaller ones. Similarly, older, well established municipalities may have better firefighting facilities than newly formed or rapidly growing ones. The level of municipal fire

**Vehicle Loads**

A special study should be undertaken to determine the distributed loads to be used for the design of floors and areas used by vehicles exceeding 9 000 kg gross weight and of driveways and sidewalks over areaways and basements. Where appropriate, the designer should refer to CAN/CSA-S6, "Canadian Highway Bridge Design Code."

**A-4.1.5.5. Loads on Exterior Areas.** In Article 4.1.5.5., "accessible" refers to the lack of a physical barrier that prevents or restricts access by vehicles or persons to the site in the context of the specific use.

**A-4.1.5.8. Tributary Area.** Information on tributary area can be found in the Commentary entitled Live Loads in the User's Guide – NBC 2010, Structural Commentaries (Part 4 of Division B).

**A-Table 4.1.5.9. Loads Due to Concentrations.** Special study is required to determine concentrated loads for the design of floors and areas used by vehicles exceeding 9 000 kg gross weight, and of driveways and sidewalks over areaways and basements. Where appropriate the designer should refer to CAN/CSA-S6, "Canadian Highway Bridge Design Code."

**A-4.1.5.11. Crane-Supporting Structures.** Guidance on crane-supporting structures can be found in CSA S16, "Design of Steel Structures."

**A-4.1.5.14. and 4.1.5.15.(1) Design of Guards.** In the design of guards, due consideration should be given to the durability of the members and their connections.

**A-4.1.5.17. Loads on Firewalls.** Information on loads on firewalls can be found in the Commentary entitled Structural Integrity of Firewalls in the User's Guide – NBC 2010, Structural Commentaries (Part 4 of Division B).

**A-4.1.6.2. Coefficients for Snow Loads on Roofs.** Information on coefficients for snow loads on roofs can be found in the Commentary entitled Snow Loads in the User's Guide – NBC 2010, Structural Commentaries (Part 4 of Division B).

**A-4.1.6.2.(4)(b) Unit Weight of Snow.** Information on the unit weight of snow can be found in the Commentary entitled Snow Loads in the User's Guide – NBC 2010, Structural Commentaries (Part 4 of Division B).

**A-4.1.6.3.(2) Full and Partial Loading under Snow Loads.** Information on full and partial snow loading on roofs can be found in the Commentary entitled Snow Loads in the User's Guide – NBC 2010, Structural Commentaries (Part 4 of Division B).

**A-4.1.6.4.(1) Rain Loads.** Information on rain loads can be found in the Commentary entitled Rain Loads in the User's Guide – NBC 2010, Structural Commentaries (Part 4 of Division B).

**A-4.1.6.4.(3) Flow Control Drains.** The National Plumbing Code of Canada 2010 (NPC) contains requirements regarding the use of flow control roof drains. The designer must ensure that the building complies with both the NPC and the NBC.

**A-4.1.7.1.(1) to (3) Pressure Coefficients for Wind Loads.** Information on pressure coefficients can be found in the Commentary entitled Wind Load and Effects in the User's Guide – NBC 2010, Structural Commentaries (Part 4 of Division B).

**A-4.1.7.1.(5)(a) to (c) Simple Procedure for Calculating  $C_e$ .** Information on the simple procedure for calculating  $C_e$  can be found in the Commentary entitled Wind Load and Effects in the User's Guide – NBC 2010, Structural Commentaries (Part 4 of Division B).

**A-4.1.7.1.(5)(d) Dynamic Approach for Wind Loads.** Information on a dynamic approach can be found in the Commentary entitled Wind Load and Effects in the User's Guide – NBC 2010, Structural Commentaries (Part 4 of Division B).

**A-4.1.7.1.(6)(a) Gust Effect Factor for the Building as a Whole and Main Structural Members.** Information on the gust effect factor for the building as a whole and for the main structural members can be found in the Commentary entitled Wind Load and Effects in the User's Guide – NBC 2010, Structural Commentaries (Part 4 of Division B).

**A-4.1.7.1.(6)(c) Gust Factors for Calculation of Internal Pressures.** Information on gust factors for the calculation of internal pressures can be found in the Commentary entitled Wind Load and Effects in the User's Guide – NBC 2010, Structural Commentaries (Part 4 of Division B).

**A-4.1.7.1.(6)(d) and 4.1.7.2.(1)(b) Dynamic Approach to the Action of Wind Gusts.** Information on a dynamic approach to the action of wind gusts can be found in the Commentary entitled Wind Load and Effects in the User's Guide – NBC 2010, Structural Commentaries (Part 4 of Division B).

**A-4.1.7.2.(1) and (2) Natural Frequency.** Information on calculating the natural frequency of a building can be found in the Commentary entitled Wind Load and Effects in the User's Guide – NBC 2010, Structural Commentaries (Part 4 of Division B).

**A-4.1.7.3.(1) Full and Partial Loading under Wind Loads.** Information on full and partial loading under wind loads can be found in the Commentary entitled Wind Load and Effects in the User's Guide – NBC 2010, Structural Commentaries (Part 4 of Division B).

#### **A-4.1.8.2.(1) Notation.**

##### **Definition of $e_x$**

Information on the calculation of torsional moments can be found in the Commentary entitled Design for Seismic Effects in the User's Guide – NBC 2010, Structural Commentaries (Part 4 of Division B).

##### **Definition of W**

Information on the definition of dead load, W, can be found in the Commentary entitled Design for Seismic Effects in the User's Guide – NBC 2010, Structural Commentaries (Part 4 of Division B).

**A-4.1.8.3.(4) General Design of the SFRS.** Information on the general design requirements for the SFRS can be found in the Commentary entitled Design for Seismic Effects in the User's Guide – NBC 2010, Structural Commentaries (Part 4 of Division B).

**A-4.1.8.3.(6) General Design of Stiff Elements.** Information on the general design requirements for stiff elements can be found in the Commentary entitled Design for Seismic Effects in the User's Guide – NBC 2010, Structural Commentaries (Part 4 of Division B).

**A-4.1.8.3.(7)(b) and (c) Stiffness Imparted to the Structure from Elements Not Part of the SFRS.** Information on stiffness imparted to the structure from elements not part of the SFRS can be found in the Commentary entitled Design for Seismic Effects in the User's Guide – NBC 2010, Structural Commentaries (Part 4 of Division B).

**A-4.1.8.3.(8) Structural Modelling.** Information on structural modelling can be found in the Commentary entitled Design for Seismic Effects in the User's Guide – NBC 2010, Structural Commentaries (Part 4 of Division B).

**A-4.1.8.4.(3) and Table 4.1.8.4.A. Site Class.** Information on Site Class can be found in the Commentary entitled Design for Seismic Effects in the User's Guide – NBC 2010, Structural Commentaries (Part 4 of Division B).

**A-Table 4.1.8.5. Serviceability Limit States for Earthquake.** Information on serviceability limit states for earthquake can be found in the Commentary entitled Design for Seismic Effects in the User's Guide – NBC 2010, Structural Commentaries (Part 4 of Division B).

**A-Table 4.1.8.6. Structural Irregularities.** Information on structural irregularities can be found in the Commentary entitled Design for Seismic Effects in the User's Guide – NBC 2010, Structural Commentaries (Part 4 of Division B).

Usually a combination of approaches is used. For example, even if the snow load calculation on a wood roof truss is based on Subsections 9.4.2., the joints must be designed in accordance with Part 4. Wall framing may comply with the prescriptive requirements in Subsections 9.23.3., 9.23.10., 9.23.11. and 9.23.12., while the floor framing may be engineered.

Design according to Part 4 or accepted good engineering practice, such as that described in CWC 2009, "Engineering Guide for Wood Frame Construction," requires engineering expertise. The CWC Guide contains alternative solutions and provides information on the applicability of the Part 9 prescriptive structural requirements to further assist designers and building officials to identify the appropriate design approach. The need for professional involvement in the structural design of a building, whether to Part 4 or Part 9 requirements or accepted good practice, is defined by provincial and territorial legislation.

**A-9.4.2.2. Application of Simplified Part 9 Snow Loads.** The simplified specified snow loads described in Article 9.4.2.2. may be used where the structure is of the configuration that is typical of traditional wood-frame residential construction and its performance. This places limits on the spacing of joists, rafters and trusses, the spans of these members and supporting members, deflection under load, overall dimensions of the roof and the configuration of the roof. It assumes considerable redundancy in the structure.

Because very large buildings may be constructed under Part 9 by constructing firewalls to break up the building area, it is possible to have Part 9 buildings with very large roofs. The simplified specified snow loads may not be used when the total roof area of the overall structure exceeds 4 550 m<sup>2</sup>. Thus, the simplified specified snow load calculation may be used for typical townhouse construction but would not be appropriate for much larger commercial or industrial buildings, for example.

The simplified specified snow loads are also not designed to take into account roof configurations that seriously exacerbate snow accumulation. This does not pertain to typical projections above a sloped roof, such as dormers, nor does it pertain to buildings with higher and lower roofs. Although two-level roofs generally lead to drift loading, smaller light-frame buildings constructed according to Part 9 have not failed under these loads. Consequently, the simplified calculation may be used in these cases. Rather, this limitation on application of the simplified calculation pertains to roofs with high parapets or significant other projections above the roof, such as elevator penthouses, mechanical rooms or larger equipment that would effectively collect snow and preclude its blowing off the roof.

The reference to Article 9.4.3.1. invokes, for roof assemblies other than common lumber trusses, the same performance criteria for deflection.

The unit weight of snow on roofs,  $\gamma$ , obtained from measurements at a number of weather stations across Canada varied from about 1.0 to 4.5 kN/m<sup>3</sup>. An average value for use in design in lieu of better local data is  $\gamma = 3.0$  kN/m<sup>3</sup>. In some locations the unit weight of snow may be considerably greater than 3.0 kN/m<sup>3</sup>. Such locations include regions where the maximum snow load on the roof is reached only after contributions from many snowstorms, coastal regions, and regions where winter rains are considerable and where a unit weight as high as 4.0 kN/m<sup>3</sup> may be appropriate.

**A-9.4.2.3.(1) Accessible Platforms Subject to Snow and Occupancy Loads.** Many platforms are subject to both occupancy loads and snow loads. These include balconies, decks, verandas, flat roofs over garages and carports. Where such a platform, or a segregated area of such a platform, serves a single dwelling unit, it must be designed for the greater of either the specified snow load or an occupancy load of 1.9 kPa. Where the platform serves more than one single dwelling unit or an occupancy other than a residential occupancy, higher occupancy loads will apply as specified in Table 4.1.5.3.

**A-9.4.2.4.(1) Specified Loads for Attics or Roof Spaces with Limited Accessibility.** Typical residential roofs are framed with roof trusses and the ceiling is insulated.

Residential trusses are placed at 600 mm on centre with web members joining top and bottom chords. Lateral web bracing is installed perpendicular to the span of the trusses. As a result, there is limited room for movement inside the attic or roof space or for storage of material. Access hatches are generally built to the minimum acceptable dimensions, further limiting the size of material that can be moved into the attic or roof space.

With exposed insulation in the attic or roof space, access is not recommended unless protective clothing and breathing apparatus are worn.

Thus the attic or roof space is recognized as uninhabitable and loading can be based on actual dead load. In emergency situations or for the purpose of inspection, it is possible for a person to access the attic or roof space without over-stressing the truss or causing damaging deflections.

**A-Table 9.4.4.1. Classification of Soils.** Sand or gravel may be classified by means of a picket test in which a 38 mm by 38 mm picket bevelled at the end at 45° to a point is pushed into the soil. Such material is classified as “dense or compact” if a man of average weight cannot push the picket more than 200 mm into the soil and “loose” if the picket penetrates 200 mm or more.

Clay and silt may be classified as “stiff” if it is difficult to indent by thumb pressure, “firm” if it can be indented by moderate thumb pressure, “soft” if it can be easily penetrated by thumb pressure, where this test is carried out on undisturbed soil in the wall of a test pit.

**A-9.4.4.4.(1) Soil Movement.** In susceptible soils, changes in temperature or moisture content can cause significant expansion and contraction. Soils containing pyrites can expand simply on exposure to air.

#### **Expansion and Contraction due to Moisture**

Clay soils are most prone to expansion and contraction due to moisture. Particularly wet seasons can sufficiently increase the volume of the soil under and around the structure to cause heaving of foundations and floors-on-ground, or cracking of foundation walls. Particularly dry seasons or draw-down of water by fast-growing trees can decrease the volume of the soil supporting foundations and floors-on-ground, thus causing settling.

#### **Frost Heave**

Frost heave is probably the most commonly recognized phenomenon related to freezing soil. Frost heave results when moisture in frost-susceptible soil (clay and silt) under the footings freezes and expands. This mechanism is addressed by requirements in Section 9.12. regarding the depth of excavations.

#### **Ice Lenses**

When moisture in frost-susceptible soils freezes, it forms an ice lens and reduces the vapour pressure in the soil in the area immediately around the lens. Moisture in the ground redistributes to rebalance the vapour pressures providing more moisture in the area of the ice lens. This moisture freezes to the lens and the cycle repeats itself. As the ice lens grows, it exerts pressure in the direction of heat flow. When lenses form close to foundations and heat flow is toward the foundation—as may be the case with unheated crawl spaces or open concrete block foundations insulated on the interior—the forces may be sufficient to crack the foundation.

#### **Adfreezing**

Ice lenses can adhere themselves to cold foundations. Where heat flow is essentially upward, parallel to the foundation, the pressures exerted will tend to lift the foundation. This may cause differential movement or cracking of the foundation. Heat loss through basement foundations of cast-in-place concrete or concrete block insulated on the exterior appears to be sufficient to prevent adfreezing. Care must be taken where the foundation does not enclose heated space or where open block foundations are insulated on the interior. The installation of semi-rigid glass fibre insulation has demonstrated some effectiveness as a separation layer to absorb the adfreezing forces.

#### **Pyrites**

Pyrite is the most common iron disulphide mineral in rock and has been identified in rock of all types and ages. It is most commonly found in metamorphic and sedimentary rock, and especially in coal and shale deposits.

Weathering of pyritic shale is a chemical-microbiological oxidation process that results in volume increases that can heave foundations and floors-on-ground. Concentrations of as little as 0.1% by weight have caused heaving. Weathering can be initiated simply by exposing the pyritic material to air. Thus, building on soils that contain pyrites in concentrations that will cause damage to the building should be avoided, or measures should be taken to remove the material or seal it. Material containing pyrites should not be used for backfill at foundations or for supporting foundations or floors-on-ground.

Where it is not known if the soil or backfill contains pyritic material in a deleterious concentration, a test is available to identify its presence and concentration.

**Table A-9.10.3.1.B. (Continued)**

- (i) fibre processed from rock, slag, or glass, and
  - (ii) loose-fill or spray-applied cellulose fibre.
- To obtain the listed sound transmission class rating, the nominal insulation thickness is 150 mm for rock, slag, or glass fibres or loose-fill cellulose fibre, and 90 mm for spray-applied cellulose fibre, unless otherwise specified. Absorptive material will affect the sound transmission class by approximately adding or subtracting 1 per 50 mm change of thickness. However, no additional sound transmission class value is achieved by adding a greater thickness of insulation than the depth of the assembly.
- (5) The fire-resistance rating and sound transmission class values are based on the spacing of ceiling supports as noted. (See also Table Note (9).) A narrower spacing will be detrimental to the sound transmission class rating, but not to the fire-resistance rating.
  - (6) To obtain the listed rating, the type and spacing of fasteners are as described in and installed in accordance with Subsection 9.29.5. or CSA A82.31-M:
    - (i) fastener distance to board edges and butt ends should be not less than 38 mm, except for fasteners on the butt ends of the base layer in ceilings with two layers (see Figure A-9.10.3.1.-B); and
    - (ii) fasteners are spaced not more than 300 mm o.c.
  - (7) See D-1.2.1.(2) in Appendix D for the significance of fire-resistance ratings.
  - (8) The sound transmission class values given in the Table are for the minimum depth of structural member noted in the description and applicable table notes. To obtain sound transmission class values for structural members deeper than that minimum, add 1 to the sound transmission class value in the Table for each 170 mm increase in structural member depth.
  - (9) The sound transmission class values given in the Table are for structural member spacing of 300 mm o.c., unless otherwise noted in the description and applicable table notes. To obtain sound transmission class values for assemblies with structural members spaced more than 500 mm o.c., add 1 to the sound transmission class value in the Table.
  - (10) The impact insulation class values given are for floor assemblies tested with no finished flooring.
  - (11) Wood floor joists are:
    - (i) wood joists with a minimum member size of 38 mm (width) x 235 mm (depth), except as otherwise noted (see Table Note (14)); or
    - (ii) wood I-joists with a minimum flange size of 38 mm x 38 mm, a minimum OSB or plywood web thickness of 9.5 mm, and a minimum joist depth of 241 mm.
  - (12) Except where assemblies with wood I-joists are tested according to CAN/ULC-S101, "Fire Endurance Tests of Building Construction and Materials," the fire-resistance rating values apply only to I-joists that have been fabricated with a phenolic-based structural wood adhesive complying with CSA O112.10 "Evaluation of Adhesives for Structural Wood Products (Limited Moisture Exposure)." For I-joists with flanges made of laminated veneer lumber (LVL), the fire-resistance rating values apply only where the adhesive used in the LVL fabrication is a phenolic-based structural wood adhesive complying with CSA O112.9 "Evaluation of Adhesives for Structural Wood Products (Exterior Exposure)."
  - (13) The fire-resistance rating value within square brackets is achieved only where absorptive material includes spray-applied cellulose fibre with
    - (i) adhesive that is capable of providing a minimum cohesive/adhesive bond strength per unit area of 5 times the weight of the material under the test plate when tested in accordance with ASTM E 736,
    - (ii) a minimum density of 35 kg/m<sup>3</sup>, and
    - (iii) a minimum thickness of 90 mm on the underside of the subfloor or deck, of 90 mm on the sides of the structural members, and for cold-formed steel joists, of 13 mm on the underside of the bottom flange other than at resilient metal channel locations.
  - (14) The fire-resistance rating value within square brackets only applies to assemblies with solid wood joists and is achieved only where absorptive material includes:
    - (i) fibre processed from rock or slag with a minimum thickness of 90 mm and a minimum surface area mass of 2.8 kg/m<sup>2</sup>; or
    - (ii) spray-applied cellulose fibre with a minimum density of 50 kg/m<sup>3</sup> and a minimum depth of 90 mm on the underside of the subfloor and of 90 mm on the sides of the floor joists.
  - (15) The fire-resistance rating, sound transmission class and impact insulation class values given are also applicable to assemblies with 38 mm (width) x 184 mm (depth) solid wood joists.
  - (16) The fire-resistance rating value within square brackets is achieved only where absorptive material includes:
    - (i) fibre processed from rock or slag with a minimum thickness of 90 mm and a minimum surface area mass of 2.8 kg/m<sup>2</sup>; or
    - (ii) spray-applied cellulose fibre with a minimum density of 50 kg/m<sup>3</sup> and a minimum depth of 90 mm on the underside of the subfloor and of 90 mm on the webs or the sides of the structural members.
  - (17) The fire-resistance rating, sound transmission class and impact insulation class values within the square brackets only apply to assemblies with solid wood joists and are achieved only where absorptive material includes dry-blown cellulose fibre with a minimum density of 40 kg/m<sup>3</sup> filling the entire cavity; the cellulose fibre is supported on zinc-coated (galvanized) steel poultry fence fabric conforming to ASTM A 390 which has 25-mm-wide hexagonal mesh openings and 0.81-mm-thick (20-gauge) wire and is attached to wood joists with metal staples having legs that are 50 mm long.
  - (18) The fire-resistance rating and sound transmission class values are achieved only where absorptive material includes:
    - (i) fibre processed from rock or slag that fills the joist cavity and has a minimum surface area mass of 2.8 kg/m<sup>2</sup>, and for structural members at least 270 mm in depth, the fibre includes three layers each of which has a minimum thickness of 90 mm; or
    - (ii) dry-blown cellulose fibre with a minimum density of 40 kg/m<sup>3</sup> filling the entire cavity; the cellulose fibre is supported on zinc-coated (galvanized) steel poultry fence fabric conforming to ASTM A 390 which has 25-mm-wide hexagonal mesh openings and 0.81-mm-thick (20-gauge) wire and is attached to wood joists or wood I-joists with metal staples having legs that are 50 mm or 30 mm long, respectively.
  - (19) The fire-resistance rating value only applies to assemblies with wood I-joists with flanges with a minimum thickness of 38 mm and a minimum width of 63 mm.

**Table A-9.10.3.1.B. (Continued)**

- (20) The fire-resistance rating and sound transmission class values are achieved only where absorptive material includes:
  - (i) fibre processed from rock or slag that fills the joist cavity and has a minimum surface area mass of 2.8 kg/m<sup>2</sup>, and for structural members at least 270 mm in depth, the fibre includes three layers each of which has a minimum thickness of 90 mm; or
  - (ii) dry-blown cellulose fibre with a minimum density of 40 kg/m<sup>3</sup> filling the entire cavity; the cellulose fibre is supported on zinc-coated (galvanized) steel poultry fence fabric conforming to ASTM A 390 which has 25-mm-wide hexagonal mesh openings and 0.81-mm-thick (20-gauge) wire and is attached to wood joists with metal staples having legs that are 50 mm long.
- (21) The fire-resistance rating values given only apply to assemblies with solid wood joists spaced not more than 400 mm o.c. No information is available for assemblies constructed with wood I-joists.
- (22) Wood floor trusses are:
  - (i) metal-plate-connected wood trusses with wood framing members not less than 38 mm x 64 mm, metal connector plates not less than 1 mm (nominal) thick with teeth not less than 8 mm long, and a minimum truss depth of 305 mm;
  - (ii) metal-web wood trusses with wood chords not less than 38 mm x 64 mm, V-shaped webs made from galvanized steel of 1 mm (nominal) thickness with plate areas having teeth not less than 8 mm long, and a minimum truss depth of 286 mm; or
  - (iii) finger-joined wood trusses with glued finger-joined connections, chord members not less than 38 mm x 64 mm, web members not less than 38 mm x 38 mm and a minimum truss depth of 330 mm, all of which is glued together with an R-14 phenol-resorcinol resin conforming to CSA O112.10.
- (23) The fire-resistance rating value within square brackets is achieved only where absorptive material includes fibre processed from rock or slag with a minimum thickness of 90 mm and a minimum surface area mass of 2.8 kg/m<sup>2</sup>.
- (24) The fire-resistance rating and sound transmission class values within square brackets are achieved only where absorptive material includes dry-blown cellulose fibre with a minimum density of 40 kg/m<sup>3</sup> filling the entire cavity; the cellulose fibre is supported on zinc-coated (galvanized) steel poultry fence fabric conforming to ASTM A 390 which has 25-mm-wide hexagonal mesh openings and 0.81-mm-thick (20-gauge) wire and is attached to wood trusses with metal staples having legs that are 38 mm long.
- (25) Cold-formed steel floor joists (C-shaped joists) are members with a minimum size of 41 mm (width) x 203 mm (depth) x 1.22 mm (material thickness).
- (26) The fire-resistance rating value within square brackets is achieved only where absorptive material includes spray-applied cellulose fibre with a minimum density of 50 kg/m<sup>3</sup> and a minimum thickness of 90 mm on the underside of the subfloor, of 90 mm on the sides of the cold-formed steel floor joists, and of 13 mm on the underside of the bottom flange other than at resilient metal channel locations.

**Figure A-9.10.3.1.-A**  
**Single layer butt joint details**

**Notes to Figure A-9.10.3.1.-A:**

- (1) Figure is for illustrative purposes only and is not to scale.
- (2) The structural member can be any one of the types described in the Table.
- (3) Adjacent gypsum board butt ends are attached to separate resilient channels using regular Type S screws, located a minimum of 38 mm from the butt end.

- yield strength 350 MPa
- deflection limit  $L/360$
- live load: first floor = 1.9 kPa; second floor = 1.4 kPa
- dead load = 1.5 kPa (0.5 kPa floor + 1.0 kPa partition)

The calculation used to establish the specified maximum beam spans also applies a revised live load reduction factor to account for the lower probability of a full live load being applied over the supported area in Part 9 buildings.

**A-9.23.4.4. Concrete Topping.** Vibration-controlled spans given in Table A-2 for concrete topping are based on a partial composite action between the concrete, subflooring and joists. Normal weight concrete having a compressive strength of not less than 20 MPa, placed directly on the subflooring, provides extra stiffness and results in increased capacity. The use of a bond breaker between the topping and the subflooring, or the use of lightweight concrete topping limits the composite effects.

Where either a bond breaker or lightweight topping is used, Table A-1 may be used but the additional dead load imposed by the concrete must be considered. The addition of 51 mm of concrete topping can impose an added load of 0.8 to 1.2 kPa, depending on the density of the concrete.

**Example**

Assumptions:

- basic dead load = 0.5 kPa
- topping dead load = 0.8 kPa
- total dead load = 1.3 kPa
- live load = 1.9 kPa
- vibration limit per A-9.23.4.2.(2)
- deflection limit =  $1/360$
- ceiling attached directly to joists, no bridging

The spacing of joists in the span tables can be conservatively adjusted to allow for the increased load by using the spans in Table A-1 for 600 mm spacing, but spacing the joists 400 mm apart. Similarly, floor beam span tables can be adjusted by using 4.8 m supported length spans for cases where the supported length equals 3.6 m.

**A-9.23.8.3. Joint Location in Built-Up Beams.**

**Figure A-9.23.8.3.**  
**Joint location in built-up beams**

**A-9.23.10.4.(1) Fingerjoined Lumber.** NLGA 2010, “Standard Grading Rules for Canadian Lumber,” referenced in Article 9.3.2.1., refers to two special product standards, SPS-1, “Fingerjoined Structural Lumber,” and SPS-3, “Fingerjoined “Vertical Stud Use Only” Lumber,” produced by NLGA. Material identified as conforming to these standards is considered to meet the requirements in this Sentence for joining with a structural adhesive. Lumber fingerjoined in accordance with SPS-3 should be used as a vertical end-loaded member in compression only, where sustained bending or tension-loading conditions are not present, and where the moisture content of the wood will not exceed 19%. Fingerjoined lumber may not be visually regraded or remanufactured into a higher stress grade even if the quality of the lumber containing fingerjoints would otherwise warrant such regrading.

# Appendix D

## Fire-Performance Ratings

### Section D-1 General

The content of this Appendix was prepared on the recommendations of the Standing Committee on Fire Safety and Occupancy, which was established by the Canadian Commission on Building and Fire Codes (CCBFC) for this purpose.

#### D-1.1. Introduction

##### D-1.1.1. Scope

- 1)** This fire-performance information is presented in a form closely linked to the performance requirements and the minimum materials specifications of the National Building Code of Canada 2010.
- 2)** The ratings have been assigned only after careful consideration of all available literature on assemblies of common building materials, where they are adequately identified by description. The assigned values based on this information will, in most instances, be conservative when compared to the ratings determined on the basis of actual tests on individual assemblies.
- 3)** The fire-performance information set out in this Appendix applies to materials and assemblies of materials which comply in all essential details with the minimum structural design standards described in Part 4 of the National Building Code of Canada. Additional requirements, where appropriate, are described in other Sections of this Appendix.
- 4)** Section D-2 of this Appendix assigns fire-resistance ratings for walls, floors, roofs, columns and beams related to CAN/ULC-S101, "Fire Endurance Tests of Building Construction and Materials," and describes methods for determining these ratings.
- 5)** Section D-3 assigns flame-spread ratings and smoke developed classifications for surface materials related to CAN/ULC-S102, "Test for Surface Burning Characteristics of Building Materials and Assemblies," and CAN/ULC-S102.2, "Test for Surface Burning Characteristics of Flooring, Floor Coverings, and Miscellaneous Materials and Assemblies."
- 6)** Section D-4 describes noncombustibility in building materials when tested in accordance with CAN/ULC-S114, "Test for Determination of Non-Combustibility in Building Materials."
- 7)** Section D-5 contains requirements for the installation of fire doors and fire dampers in fire-rated stud wall assemblies and the installation of fire stop flaps in fire-rated membrane ceilings.
- 8)** Section D-6 contains background information regarding fire test reports, obsolete materials and assemblies, assessment of archaic assemblies and the development of the component additive method.

##### D-1.1.2. Referenced Documents

- 1)** Where documents are referenced in this Appendix, they shall be the editions designated in Table D-1.1.2.

---

This Appendix is included for explanatory purposes only and does not form part of the requirements. The bold face reference numbers that introduce each item do not relate to specific requirements in this Division.

**Notes to Table D-1.1.2.:**

(1) Some documents may have been reaffirmed or reapproved. Check with the applicable issuing agency for up-to-date information.

(2) Some titles have been abridged to omit superfluous wording.

**D-1.1.3. Applicability of Ratings**

The ratings shown in this document apply if more specific test values are not available. The construction of an assembly that is the subject of an individual test report must be followed in all essential details if the fire-resistance rating reported is to be applied for use with this Code.

**D-1.1.4. Higher Ratings**

The authority having jurisdiction may allow higher fire-resistance ratings than those derived from this Appendix, where supporting evidence justifies a higher rating. Additional information is provided in summaries of published test information and the reports of fire tests carried out by the Institute for Research in Construction, National Research Council of Canada, included in Section D-6, Background Information.

**D-1.1.5. Additional Information on Fire Rated Assemblies**

Assemblies containing materials for which there is no nationally recognized standard are not included in this Appendix. Many such assemblies have been rated by Underwriters Laboratories (UL), Underwriters' Laboratories of Canada (ULC), or Intertek Testing Services NA Ltd. (ITS).

**D-1.2. Interpretation of Test Results**

**D-1.2.1. Limitations**

**1)** The fire-performance ratings set out in this Appendix are based on those that would be obtained from the standard methods of test described in the Code. The test methods are essentially a means of comparing the performance of one building component or assembly with another in relation to its performance in fire.

**2)** Since it is not practicable to measure the fire resistance of constructions in situ, they must be evaluated under some agreed test conditions. A specified fire-resistance rating is not necessarily the actual time that the assembly would endure in situ in a building fire, but is that which the particular construction must meet under the specified methods of test.

**3)** Considerations arising from departures in use from the conditions established in the standard test methods may, in some circumstances, have to be taken into account by the designer and the authority having jurisdiction. Some of these conditions are covered at present by the provisions of the National Building Code.

4) For walls and partitions, the stud spacings previously specified as 16 or 24 inch have been converted to 400 and 600 mm, respectively, for consistency with other metric values; however, the use of equivalent imperial dimensions for stud spacing is permitted.

### **D-1.3. Concrete**

#### **D-1.3.1. Aggregates in Concrete**

Low density aggregate concretes generally exhibit better fire performance than natural stone aggregate concretes. A series of tests on concrete masonry walls, combined with mathematical analysis of the test results, has allowed further distinctions between certain low density aggregates to be made.

### **D-1.4. Types of Concrete**

#### **D-1.4.1. Description**

1) For purposes of this Appendix, concretes are described as Types S, N, L, L<sub>1</sub>, L<sub>2</sub>, L40S, L<sub>1</sub>20S or L<sub>2</sub>20S as described in Sentences (2) to (8).

2) Type S concrete is the type in which the coarse aggregate is granite, quartzite, siliceous gravel or other dense materials containing at least 30% quartz, chert or flint.

3) Type N concrete is the type in which the coarse aggregate is cinders, broken brick, blast furnace slag, limestone, calcareous gravel, trap rock, sandstone or similar dense material containing not more than 30% of quartz, chert or flint.

4) Type L concrete is the type in which all the aggregate is expanded slag, expanded clay, expanded shale or pumice.

5) Type L<sub>1</sub> concrete is the type in which all the aggregate is expanded shale.

6) Type L<sub>2</sub> concrete is the type in which all the aggregate is expanded slag, expanded clay or pumice.

7) Type L40S concrete is the type in which the fine portion of the aggregate is sand and low density aggregate in which the sand does not exceed 40% of the total volume of all aggregates in the concrete.

8) Type L<sub>1</sub>20S and Type L<sub>2</sub>20S concretes are the types in which the fine portion of the aggregate is sand and low density aggregate in which the sand does not exceed 20% of the total volume of all aggregates in the concrete.

#### **D-1.4.2. Determination of Ratings**

Where concretes are described as being of Type S, N, L, L<sub>1</sub> or L<sub>2</sub>, the rating applies to the concrete containing the aggregate in the group that provides the least fire resistance. If the nature of an aggregate cannot be determined accurately enough to place it in one of the groups, the aggregate shall be considered as being in the group that requires a greater thickness of concrete for the required fire resistance.

#### **D-1.4.3. Description of Aggregates**

1) The descriptions of the aggregates in Type S and Type N concretes apply to the coarse aggregates only. Coarse aggregate for this purpose means that retained on a 5 mm sieve using the method of grading aggregates described in CSA A23.1/A23.2, "Concrete Materials and Methods of Concrete Construction/Test Methods and Standard Practices for Concrete."

2) Increasing the proportion of sand as fine aggregate in low density concretes requires increased thicknesses of material to produce equivalent fire-resistance ratings. Low density aggregates for Type L and Types L-S concretes used in loadbearing components shall conform to ASTM C 330M, "Lightweight Aggregates for Structural Concrete."

3) Non-loadbearing low density components of vermiculite and perlite concrete, in the absence of other test evidence, shall be rated on the basis of the values shown for Type L concrete.
